4. The best part; that which is best in quality: that which is of prime or high quality or grade, as fish, oysters, etc.; often, in the plural, a prime grade or quality.

And but little at a time.
Swift, Verses on a Lady.

5. In *fencing:* (*a*) The first of eight parries or guards against thrusts in sword-play, afterward retained in exercise with the foils; the first guard a swordsman surprised by an attack could make, while drawing his weapon from the scabbard near his left thigh. It was followed by parries in *seconde*, *tierce*, *quarte*, up to *octave*, according as thrusts followed at the openings in the defense made by such guards. In prime guard the point remains low, the hand higher than the eyes, as in drawing the sword, and the knuckles are upward. It is the ordinary position of the German student "on guard," when fencing with the schlager. Hence—(*b*) Sometimes, the first and simplest thrust (and parry) which can be made after two fencers have crossed foils and are "on guard" with the left sides of their foils touching: used thus for the direct thrust. This is by some writers called *modern prime*, while the true prime is called *ancient* or *old prime*. In both *old* and *modern prime* the word *prime* is used to indicate the thrust as well as the parry or guard; but this comes from suppression of "in": thus, prime thrust, for thrust in *prime*. *Prime*, *seconde*, etc., represent numbered sections of an ideal chart covering such parts of a swordsman's trunk as are visible to his opponent, each of which sections is supposed to be guarded by the parry thus numbered. Hence the meaning of a "thrust in prime," etc.

6. In *chem.*, a number employed, in conformity with the doctrine of definite proportions, to express the ratios in which bodies enter into combination. Primes duly arranged in a table constitute a scale of chemical equivalents. They also express the ratios of atomic weights.

7. A prime number; an integer number not divisible without remainder by any number except itself and unity.—8†. (*a*) The game of primero.

(*b*) A term used in the playing of this game.—9. In *music:* (*a*) A tone on the same degree of the scale or staff with a given tone. (*b*) The interval between any tone and a tone on the same degree with it. (*c*) The simultaneous combination of two tones on the same degree. (*d*) In a scale, the first tone; the tonic or keynote. The typical interval of the prime is the unison, acoustically represented by the ratio 1:1; such a prime is called *perfect* or *major*. A prime in which one tone is a half-step above the other is called *augmented* or *superfluous*. The perfect prime is the most perfect of all consonances—so perfect, indeed, that in its ideal form it is better described as a unison than as a consonance. In harmony, the parallel motion of two voices in perfect primes is forbidden, except when a strictly melodic effect is desired; such primes are called *consecutive*. Compare *consecutive fifth* and *consecutive octave*, under *consecutive*.

10. One of the fractions into which a unit is immediately divided; a minute. It is generally $\frac{1}{60}$, but sometimes $\frac{1}{100}$. Hence, an accent as the symbol of such a fraction: thus *b*′, in algebra, is read "*b prime*."

See *ideal*.—**Primary prime**, a complex prime number of the form $ab-1$ such that if of the two coefficients one is odd while the other is even then the number is congruent to unity on the modulus 2 ($1-i$) (this definition includes $1-i$ as a primary prime, but some authors consider this as not of the class, because it is not a primary number); more generally, a complex prime number which is at the same time a primary number.—**Prime of the moon**, the new moon when it first appears after the change.

A reformed primer was set forth under Henry VIII. in 1545, and continued in use with alterations till 1575. A new series of primers began in 1553, and unauthorized primers were also often issued. Books of devotion closely resembling the old primers in contents and character are extensively used among Anglicans at the present day.

See cut at *protovertebra*. (*b*) Primary or first of its kind; temporary and soon to disappear: opposed to *definitive*: as, the *primitive* aorta.—5. In *bot.*, noting specific types, in opposition to forms resulting from hybridization. *Henslow.*—6. In *geol.*, of the earliest or supposed earliest formation: in the early history of geology noting the older crystalline rocks of which the age and stratigraphical relations were uncertain, and the fossils (where these had once been present) either entirely obliterated or rendered so indistinct by metamorphism of the strata in which they were embedded that their determination was a matter of doubt. Many of the rocks formerly called *primitive* are now known to be more or less thoroughly metamorphosed Paleozoic strata, and in the progress of geological investigation they have been referred to their place in the series of stratified formations. Other so-called *primitive* rocks belong to the azoic or archæan series (as this latter term was and still is used by Dana)—that is, they unmistakably underlie unconformably the oldest known fossiliferous strata. These azoic rocks are made up in part of eruptive masses, and in part of highly metamorphosed sedimentary deposits which, so far as can be determined from existing evidence, were deposited before the appearance of life on the earth. As there is much primitive rock of which the geological age has not as yet been fixed, it has been found convenient to designate this simply as *crystalline* or *metamorphic*; such rocks are, however, often called *archæan*; but this cannot be properly done until their infra-Silurian position has been established by observation.

These remarkable formations [granite, granitic schist, roofing-slate, etc.] have been called *primitive*, from their having been supposed to constitute the most ancient mineral productions of the globe, and from a notion that they originated before the earth was inhabited by living beings, and while yet the planet was in a nascent state. *Sir C. Lyell*, Prin. of Geol. (4th ed., 1835), III. 336.

Primitive aorta. See *aorta*.—**Primitive axes of coordinates**, that system of axes to which the points of a magnitude are first referred with reference to a second set, to which they are afterward referred.—**Primitive carotid artery**, the common carotid artery.—**Primitive cerebral cleft.** See *cleft*¹.—**Primitive chord**, in *music*, a chord in its original position—that is, with its root in the lowest voice-part.—**Primitive circle**, in the stereographic projection of the sphere, the circle on the plane of which the projection is made.—**Primitive colors**, in *painting*, red, yellow, and blue: so called because it was erroneously believed that from mixtures of these all other colors could be obtained. In regard to mixtures of pigments, this very rudely approximates to the truth; in regard to true mixtures of colors, it is strikingly false. See *color*.—**Primitive contravariant, dislocation, equation.** See the nouns.—**Primitive curve, surface**, etc., that from which another is derived.—**Primitive fathers.** See *fathers of the church*, under *father*.—**Primitive fibrillæ**, the extremely fine filaments of which the axis-cylinder of a nerve-fiber is composed. Thus, the form

$$x^2 - 4xy + 2y^2,$$

by means of the transformation

$$x = \xi - 3\eta$$
$$y = 2\xi - 5\eta$$

(the determinant of which is unity), is shown to be equivalent to

$$\xi^2 - 2\xi\eta - \eta^2,$$

and this latter is evidently primitive.—**Primitive groove**, the first furrow which appears along the midline of the back of a vertebrate embryo, in the site of the future cerebrospinal axis. It is the very earliest characteristic mark or formation of a vertebrate, caused by a sinking in of a line of cells of the ectoblast, and a rising up of other cells of the same blastodermic layer to form right and left ridges or lips of the groove, which lips soon grow together and thus convert the groove into a tube, within which the cerebrospinal axis is developed. Also called *primitive furrow*, *streak*, and *trace*.—**Primitive group.** See *group*¹.—**Primitive Methodist Connection**, a Wesleyan denomination founded in 1810 by Hugh Bourne. In doctrine it is in substantial accord with other Methodist churches; in polity it is substantially Presbyterian. It is found principally in England, the British colonies, and the United States, and numbers about 200,000 members.—**Primitive Nth root of unity**, an imaginary root of unity which is not a root of unity of a lower order than *N*.—**Primitive plane**, in spherical projection, the plane upon which the projections are made, generally coinciding with some principal circle of the sphere.—**Primitive radii.** Same as *proportional radii* (which see, under *radius*).—**Primitive root of a prime number** *p*, a number whose *p*th power diminished by unity is the lowest power of it divisible by *p*.—**Primitive root of the binomial congruence appertaining to the exponent** *n*, a number which satisfies the congruence $x^l \pmod p$ and no similar congruence of lower degree.—**Primitive sheath**, the membranous sheath of neurokeratin lying in medullated nerve-fibers outside of the white substance of Schwann. Also called *sheath of Schwann*, and *neurilemma*.=**Syn.** 1 and 2. *Pristine*, etc. See *primary*.

J. Adams, Works, IV. 549.

2. Descent to the eldest son; the principle or right by which (under the Norman law introduced into England) the oldest son of a family succeeds to the father's real estate in preference to, and to the absolute exclusion of, the younger sons and daughters. The ancient customs of gavelkind and borough-English form exceptions to the general rule of law as to primogeniture. (See *gavelkind* and *borough-English.*) In the modified form of the law of primogeniture now existing in England, the law, if left to operate, carries the land of a person dying to male heirs singly, in succession preferring the eldest, but to female heirs equally in common, and carries personalty to wife and children with no preference for the eldest son.

He was the first-born of the Almighty, and so, by the title of *primogeniture*, heir of all things.
South, Sermons, IV. x.

The abolition of *primogeniture*, and equal partition of inheritances, removed the feudal and unnatural distinctions which made one member of every family rich and all the rest poor, substituting equal partition, the best of all agrarian laws. *Jefferson*, Autobiog., p. 40.

Primogeniture, as we know it in our law, had rather a political than a civil origin, and comes from the authority of the feudal lord and probably from that of the tribal chief; but here and there on the Continent there are traces of it as a civil institution, and in such cases the succession of the eldest son does not exclude provision for the younger sons by what are called appanages.
Maine, Early Law and Custom, p. 261.

Representative primogeniture, the rule of feudal inheritance by which the issue of a deceased child were regarded as standing in the place of that child, subject to the same preference of males over females among them, and of elder over younger males among them, as obtained among children inheriting directly: so that, if an elder son died leaving sons and daughters, the eldest of the sons would take what his father, if living, would have taken.

primogenitureship (prī-mō-jen'i-tūr-ship), *n.* [< *primogeniture* + *-ship.*] The state or right of a first-born son.

By the aristocratical law of *primogenitureship* in a family of six children, five are exposed. Aristocracy has never but one child. *Burke*, Appeal to the Old Whigs.

First in order; earliest; original; primitive; existing from the beginning.

I have sometimes thought that the States in our system may be compared to the *primordial* particles of matter, . . . whose natural condition is to repel each other, or, at least, to exist in their own independent identity.
R. Choate, Addresses, p. 401.

Of all the results of geological and palæontological investigation during the past half-century, there is no one so remarkable as the revelation of the existence of the so-called *primordial* fauna. It is now clearly established that there was a time when life was represented by a few forms, which were essentially the same all over the globe. What has long been known to be true for Europe and America has been recently supplemented for Asia, by the investigations of Richthofen in China, where the peculiar *primordial* fauna seems to be largely developed, bearing, as Professor Dames remarks, "an astonishing resemblance to that of North America and Scandinavia."
Whitney and Wadsworth, The Azoic System, p. 546.

Primordial cell, in *bot.*, a cell of the simplest character, one which does not possess a cell-wall.—**Primordial utricle**, in *bot.*, the layer of somewhat denser protoplasm which lines the inner surface of the wall of a vacuolated cell.—**Primordial zone**, the name given by Barrande to certain strata in Bohemia which there contain the lowest fauna, pretty nearly the equivalent of the Potsdam sandstone of the New York Survey, and of the Cambrian of North Wales. In these various regions, as well as in other parts of the globe, as in China and the Cordilleras, the fauna of the primordial zone is strikingly similar, consisting largely of trilobites and brachiopods, certain genera of which appear to have had a world-wide distribution.—**Syn. 1.** *Prime*, etc. See *primary.*

Cf. *primerole*, *primrose*.] 1. A genus of gamopetalous plants, the primroses, type of the order *Primulaceæ* and the tribe *Primuleæ*, characterized by a conspicuous salver-shaped corolla, with five opposite stamens borne on its long tube, and by a roundish five-valved and one-celled capsule, containing many peltate seeds. There are about 130 species, mainly mountain-dwellers of Europe

and Asia, with 5 in the United States, 1 in extreme South America, and 1 in the mountains of Java. They are beautiful low-growing plants, with perennial rootstocks. The leaves are all radical, obovate or roundish, entire or toothed, and form a spreading tuft. The flowers are dimorphous, some having a short style and stamens borne high up on the tube, others opposite in both respects. They are white, pink, purple, or yellow in color, grouped in bracted umbels—in the true primrose, however, appearing as if on separate stalks. The common *P. veris* of Europe and northern Asia, elsewhere in gardens, with yellow or straw-colored flowers in early spring, has three varieties, often regarded as species, corresponding to the names *primrose* (*P. vulgaris*), *cowslip* or *paigle* (*P. veris*), and *oxlip* (*P. elatior*). It is, however, generally believed that *P. elatior* is a good species, indigenous, though rare, in England, called *Bardfield oxlip*; and, according to Darwin, *P. vulgaris* and *P. veris* are also distinct, while the common oxlip is a hybrid between them. (See the above common names, and *herb-peter* (*St.-Peter's-wort*), *lady-key*, *petty mullein* (under *mullein*), and *palsywort*.) Numerous other species are beautiful and more or less cultivated. See *auricula*, *baziers*, *bear's-ear*, *dusty-miller*, *French cowslip* (under *cowslip*), *polyanthus*, and *primrose*.

2. [*l. c.*] Any plant of the genus *Primula*.

Primulaceæ (prim-ū-lā'sē-ē), *n. pl.* [NL. (Ventenat, 1799), < *Primula* + *-aceæ*.] A very distinct order of gamopetalous herbs of the cohort *Primulales*, characterized by its five stamens opposite to the five lobes of the regular corolla, and the capsular ovary containing two or more ovules, a single style, and an undivided stigma; the primrose family. It includes about 315 species, classed under 4 tribes and 25 genera, natives of temperate regions and mainly alpine, rare in the southern hemisphere. They are herbs, growing usually from a perennial rootstock; the few that occur in the tropics become there annuals, an inversion of the usual effect of the tropics. They bear undivided or rarely lobed leaves, either all radical, or alternate, opposite, or whorled; and commonly racemed, umbeled, or long-stalked flowers. Very many of the most-prized flowers of cultivation belong to this family, as the primrose, cowslip, polyanthus, auricula, cyclamen, and soldanelle. For the best-known genera, see *Primula* (the type), *Lysimachia*, *Cyclamen*, *Trientalis*, *Glaux*, *Coris*, *Samolus*, *Soldanella*, *Dodecatheon*, and *Hottonia*.

primulaceous (prim-ū-lā'shius), *a.* Of or resembling the *Primulaceæ*.

Primulales (prim-ū-lā'lēz), *n. pl.* [NL. (Lindley, 1833), < *Primula*, q. v.] A cohort of gamopetalous plants of the series *Heteromeræ*, distinguished by a one-celled ovary with a central and basal placenta, and stamens opposite the regular corolla-lobes. It includes 3 orders, of which the *Myrsineæ*, mainly tropical trees, and the *Primulaceæ*, herbs of temperate regions, are alike in their simple style and stigma, whereas the *Plumbagineæ* are mainly maritime herbs, with five styles.

Primuleæ (pri-mū'lē-ē), *n. pl.* [NL. (Endlicher, 1836), < *Primula* + *-eæ*.] A tribe of plants of the order *Primulaceæ*, characterized by the regular imbricated corolla-lobes, stamens on the corolla, superior ovary, and half-anatropous ovules. It includes 12 genera, of which *Primula* is the type.

primulin (prim'ū-lin), *n.* [< NL. *Primula* + *-in*[2].] A crystallizable substance obtained from the root of the cowslip.

primum frigidum (prī'mum frij'i-dum). [L.: *primum*, neut. of *primus*, first; *frigidum*, neut. of *frigidus*, cold: see *prime* and *frigid*.] Pure cold: an elementary substance, according to the doctrine of Parmenides.

The first means of producing cold is that which nature presenteth us withal, namely, the expiring of cold out of the inward parts of the earth in winter, when the sun hath no power to overcome it, the earth being (as hath been noted by some) *primum frigidum*.
Bacon, Nat. Hist., I. 69.

The dispute which is the *primum frigidum* is very well known among naturalists; some contending for the earth, others for water, others for the air, and some of the moderns for nitre, but all seeming to agree that there is some body or other that is of its own nature supremely cold, and by participation of which all other bodies obtain that quality. But, for my part, I think that before men had so hotly disputed which is the *primum frigidum* they would have done well to inquire whether there be any such thing or no. *Boyle*, Experimental History of Cold, title xvii.

primum mobile (prī'mum mob'i-lē). [L.: *primum*, neut. of *primus*, first; *mobile*, neut. of *mobilis*, movable: see *prime* and *mobile*[1].] In the Ptolemaic system of astronomy, the tenth or outermost of the revolving spheres of the universe, which was supposed to revolve from east to west in twenty-four hours, and to carry the others along with it in its motion; hence, any great or first source of motion.

The motions of the greatest persons in a government ought to be as the motions of the planets under *primum mobile*, . . . carried swiftly by the highest motion, and softly in their own motion.
Bacon, Seditions and Troubles.

A star does not move more obediently from east to west than Bacon obeys, and appropriates as his own, the motion of his *primum mobile*, the King.
E. A. Abbott, Bacon, p. 240.

primus (prī'mus), *n.*; pl. *primi* (-mī). [L., first: see *prime*.] The first in dignity among the bishops of the Scottish Episcopal Church. He is chosen by the other bishops, presides at all their meetings, and has certain other privileges, but possesses no metropolitan authority.

Wha will *prin* my sma' middle,
Wi' the short *prin* and the lang?

prin[2]† (prin), *a.* [< OF. *prin*, var. of *prim*, thin, slender: see *prim*[1].] Slender; thin.

Hee looks as gaunt and *prin* as he that spent
A tedious twelve years in an eager Lent.
Fletcher, Poems, p. 140. (*Halliwell.*)

prince (prins), *n.* [< ME. *prince*, *prynce* = D. *prins* = MLG. *prince*, *prinse* = MHG. *prinze*, G. *prinz* = Sw. Dan. *prins*, < OF. (and F.) *prince* = Pr. *princep*, *prince*, *prinsi* = Sp. Pg. It. *principe*, a prince; < L. *princeps* (*-cip-*), a first or chief person, a chief, superior, leader, ruler, sovereign, prince, prop. adj., first in time or order, < *primus*, prime, first, + *capere*, take, choose: see *capable*.] 1. A sovereign; a king; by extension, a royal personage of either sex.

As this noble *Prince* is endued with mercie, pacience, and moderation, so is she adourned with singuler beautie and chastitie. *Lyly*, Euphues and his England, p. 454.

Such duty as the subject owes the *prince*.
Shak., T. of the S., v. 2. 155.

Motley, Hist. Netherlands, II. 329.

Some of the Mercian Kings were very powerful *Princes*.
E. A. Freeman, Old Eng. Hist., p. 39.

2. The title of the ruler of a principality: as, the *Prince* of Waldeck; the former *Princes* of Orange. Few such principalities now exist in Europe; they are either small in extent (as Montenegro and Monaco), or in certain relations subordinate in name or reality to a suzerain (as Bulgaria), or to a central government (as Lippe, Waldeck, and the other principalities of the German empire).

3. A title of nobility in certain countries on the continent, superior to *duke*: as, *Prince* Bismarck; *Prince* of Condé. There are, however, many exceptions in the relative standing of particular titles, owing to the fact that many princely designations are little more than courtesy titles, or to the circumstance that some princely titles are historically and intrinsically of comparatively small importance, while some ducal titles, on the contrary, are of the highest, sometimes even of sovereign dignity. *Prince* is the translation of the chief Russian title of nobility (*knyaz*).

4. A courtesy title given to non-regnant members of royal families, and often confined to the younger sons of the sovereign: as, *Prince* Arthur (of Great Britain); *Prince* Henry (of Prussia); the eldest sons are usually called *prince* with a territorial title (as *Prince* of Wales, in Great Britain; *Prince* of Naples, in Italy), *crown prince* (Greece), *prince imperial* (Austria, Germany, etc.), *prince royal* (Denmark, Sweden, etc.), or *duke* with a territorial title (as *Duke* of Sparta, in Greece; *Duke* of Brabant, in Belgium).

The empress and young *princes* of the blood of both sexes. *Swift*, Gulliver's Travels, I. 2.

It may indicate a son of the *sovereign*, or the grade of prescriptive rank next to that of the *sovereign*, or it may be a general word for *king*, etc., as often in Shakspere. A country not large enough to be ruled by a *king* may be ruled by a *prince*, as some of the states of Germany, and Montenegro. *Sovereign* is an impressive but somewhat general term, being applicable to a *king* or an *emperor*, and expressing a high degree of power and dignity. *Monarch* expresses the fact of ruling alone, and therefore is generally, though not necessarily, applied to one ruling autocratically and with splendid state, with similar figurative use. *Emperor* is sometimes affected, as a grander word than *king*, and seems to express more of absolute rule, but there have been kings of all degrees of absolutism and grandeur. Historically, *emperor* is especially associated with military command.

principiation (prin-sip-i-ā′shon), *n.* [< *principiate* + *-ion*.] Analysis; reduction to constituent or elemental parts.

The separating of any metal into his original, or materia prima, or element, or call them what you will; which work we will call *principiation*. *Bacon*, Physiological Remains.

principium (prin-sip′i-um), *n.*; pl. *principia* (-ä). [L., beginning: see *principle*.] One of four solemn argumentations formerly held by every sententiary bachelor in theology, one upon each of the four books of Peter Lombard's "Sentences."

principle (prin′si-pl), *n.* [With unorig. *l* (as also in *participle*, *syllable*), < OF. (and F.) *principe* = Sp. Pg. It. *principio*, < L. *principium*, a beginning, < *princeps* (*-cip-*), first: see *prince*.] 1†. Beginning; commencement.

He gan to burne in rage, and friese in feare,
Doubting sad end of *principle* unsound.
Spenser, F. Q., V. xi. 2.

2. Cause, in the widest sense; that by which anything is in any way ultimately determined or regulated.

The Stoics could not but think that the fiery *principle* would wear out all the rest, and at last make an end of the world. *Sir T. Browne*, To a Friend.

What deep joy fills the mind of the philosopher when, throughout apparently inextricable confusion, he can trace some great *Principle* that governs all events, and that they all show forth. *Channing*, Perfect Life, p. 109.

Without entering on the various meanings of the term *Principle*, which Aristotle defines, in general, that from whence anything exists, is produced, or is known, it is sufficient to say that it is always used for that on which something else depends; and thus both for an original law and for an original element. In the former case it is a regulative, in the latter a constitutive, *principle*.
Sir W. Hamilton, Reid, Note A, § 5, Supplementary Dissertations.

It is only by a very careful observation . . . that we are able from the singular and concrete operations to enunciate precisely the general law which is the expression of the regulative *principle*. *McCosh*, Locke's Theory, p. 5.

3. An original faculty or endowment of the mind: as, the *principle* of observation and comparison.

Under this title are comprehended all those active *principles* whose direct and ultimate object is the communication either of enjoyment or of suffering to any of our fellow-creatures. *D. Stewart*, Moral Powers, I. 3, § 1.

Active impulse comes under the dominion of the *principle* of habit. *J. Sully*, Outlines of Psychol., p. 525.

4. A truth which is evident and general; a truth comprehending many subordinate truths; a law on which others are founded, or from which others are derived: as, the *principles* of morality, of equity, of government, etc. In mathematical physics a *principle* commonly means a very widely useful theorem.

How doth Aristotle define *principles*? In this manner: *principles* be true propositions, having credit of themselves, and need no other proofs.
Blunderville, Logic (1619), vi. 18.

Doctrines . . . laid down for foundations of any science . . . [are] called *principles*.
Locke, Human Understanding, IV. xii. 1.

When a man attempts to combat the *principle* of utility, it is with reasons drawn, without his being aware of it, from that very *principle* itself.
Bentham, Introd. to Morals and Legislation, i. 13.

Many traces of this ancient theory [regarding the English common law as existing somewhere in the form of a symmetrical body of express rules, adjusted to definite *principles*] remain in the language of our judgments and forensic arguments, and among them we may perhaps

place the singular use of the word *principle* in the sense of a legal proposition elicited from the precedents by comparison and induction.

Maine, Village Communities, p. 335.

5. That which is professed or accepted as a law of action or a rule of conduct; one of the fundamental doctrines or tenets of a system: as, the *principles* of the Stoics or of the Epicureans; hence, a right rule of conduct; in general, equity; uprightness: as, a man of *principle*.

If I had a thousand sons, the first humane *principle* I would teach them should be to forswear thin potations.

Shak., 2 Hen. IV., iv. 3. 133.

They dissolved themselves and turned Seekers, keeping that one *principle*, That every one should have liberty to worship God according to the light of their own consciences. *N. Morton*, New England's Memorial, p. 154.

In all governments truly republican, men are nothing —*principle* is everything.

D. Webster, Speech at Salem, Mass., Aug. 7, 1834.

The party whose *principles* afforded him [James II.] no guarantee would be attached to him by interest. The party whose interests he attacked would be restrained from insurrection by *principle*. *Macaulay*, Hist. Eng., vii.

The man of *principle* — that is, the man who, without any flourish of trumpets, titles of lordship, or train of guards, without any notice of his action abroad, expecting none, takes in solitude the right step uniformly, on his private choice, and disdaining consequences — does not yield, in my imagination, to any man.

Emerson, War.

6. In *chem.*: (*a*) A component part; an element: as, the constituent *principles* of bodies. (*b*) A substance on the presence of which certain qualities, common to a number of bodies, depend. See *proximate principles*, under *proximate*.

Confinement to a single alimentary *principle*, or to any one class of them alone, is sure to be followed by disease.

Huxley and Youmans, Physiol., § 429.

7. In *patent law*, a law of nature, or a general property of matter, a rule of abstract science. *George Ticknor Curtis.* A principle is not patentable, although a process for utilizing a principle may be. Compare *process*.

It is very difficult to distinguish it [the specification of the hot-blast furnace for throwing hot air into a furnace instead of coal, thereby increasing the intensity of the heat] from the specification of a patent for a *principle*, and this at first created in the minds of the court much difficulty; but, after full consideration, we think that the plaintiff does not merely claim a *principle*, but a machine embodying a *principle*, and a very valuable one. We think the case must be considered as if, the *principle* being well known, the plaintiff had first invented a mode of applying it by a mechanical apparatus to furnaces, and his invention then consists in this — by interposing a receptacle for heated air between the blowing apparatus and the furnace. *Baron Parke*, 8 Meeson & W., 306.

A principle of human nature, a law of action in human beings; a constitutional propensity common to the human species. — **Archimedean principle.** See *Archimedean*. — **Bitter principles, commutative principle, constitutive principles.** See the adjectives. — **Carnot's principle**, a highly important principle of the theory of heat — namely, that the work done by an engine is proportional to the amount of heat used multiplied into the fall of temperature of that heat in the action of the engine. In the mechanical theory of heat, this principle is transformed into the second law of thermodynamics. It was discovered in 1824 by Sadi Carnot (1796–1832), son of the great war-minister Carnot. — **D'Alembert's principle**, an important principle of mechanics, to the effect that the forces impressed upon a mechanical system may be resolved into forces balancing one another perpendicular to the motions of the particles and of forces whose direct effects would be to make the particles move as they do move. — **Declination of principles.** See *declination*. — **Dirichlet's (or Dirichletian) principle**, a certain important proposition concerning the equation

$$\frac{\partial^2 P}{\partial x^2} + \frac{\partial^2 P}{\partial y^2} = 0.$$

Distributive principle. See *distributive*. — **Döppler's principle**, in *acoustics*, the phenomenon that, when a sound-body is rapidly approaching the ear, the pitch of the sound is raised, because more sound-waves reach the ear per second, and conversely if the sounding body recedes. This principle is also applied in optics, and the rapidity of relative approach or recession of the earth and some of the fixed stars has been deduced from it, by the change in the character of the light (as to wave-length), as shown by the spectroscope. — **Extractive principle.** Same as *extract*, 4. — **First principle**, one of the most general principles, not deducible from others. — **Fruitful principle.** See *fruitful*. — **General principle.** See *general*. — **Helmholtz's principle**, the proposition (enunciated by Helmholtz, a German physicist, born 1821) that if any source of light or of sound situated at any point will by the intervention of any system of reflectors or lenses produce any given intensity of illumination or of sound at any second point, then the same source being placed at the second point would produce the same intensity of radiation at the first point. — **Heterogeneous principle, heteronymous principles, immanent principle.** See the adjectives. — **Huygens's principle**, the proposition (enunciated by Christian Huygens in 1678) that any disturbance due to waves in any part of a medium at any instant is that due to the superposition of all the disturbances reaching it at that instant from the neighboring parts of the medium. — **Hypostatic principle**, a chemical element. — **Material principle.** See *material*. — **Organic principles.** Same as *proximate principles* (which see, under *proximate*). — **Principle of areas**, in *dynam.*, the proposition that, if all the external forces acting upon a moving system are directed toward an axis, the rotation-area for that axis will be described with a uniform motion. — **Principle of causality.** See *law of causation*, under *causation*. — **Principle of certainty, of coincidence.** See *certainty, coincidence*. — **Principle of conservation of number**, in *geom.*, the proposition that, if there is a finite number of figures of a given general description subject to certain conditions, then this number remains, if finite, of the same value, however the general description be specialized. For example, if we wish to know how many lines can cut four given lines, we take four special lines, say two cutting one another and two others cutting one another. Then there are evidently just two lines — namely the one through the two points of intersection and the one common to the planes of the two pairs — which cut all the four lines; and consequently the same will be true in all cases where the number remains finite. — **Principle of contradiction.** See *contradiction*. — **Principle of correspondence**, in *geom.*, the principle that, if the points on a line have an m to n correspondence with one another, there are $m + n$ points which correspond to themselves. There is also an extension to the plane. — **Principle of duality, of homogeneity, of identity.** See *duality*, etc. — **Principle of least action, of least constraint.** See *action, constraint*. — **Principle of similitude**, in *dynam.*, proposition 32 of section 7 of the Second Book of Newton's "Principia," namely that, if two systems are geometrically similar, and have their corresponding masses proportional, and begin to move in the same way, in proportional times, they will continue to move in the same way, provided the forces are proportional to the masses and the linear dimensions, and are inversely as the squares of the times. — **Principle of sufficient reason.** See *reason*. — **Principle of the arithmetical mean**, the proposition that the mean of different results of direct observation of a quantity is the best way of combining them. — **Principle of the composition of rotations.** See *rotation*. — **Principle of the inclined plane**, in *mech.*, same as *principle of the parallelogram of forces* (which see, under *force*[1]). — **Principle of the last multiplier**, a certain principle used in the solution of dynamical equations. — **Principle of the lever**, in *mech.*, same as *Archimedean principle* (*a*) (which see, under *Archimedean*). — **Principle of the parallelogram of forces.** See *force*[1]. — **Principle of translation**, in *math.*, the theorem that all the invariantive properties of a ternary form can be represented by the vanishing of invariants and the identical vanishing of covariants, contravariants, or mixed forms. — **Principle of virtual velocities.** See *velocity*. — **Reductive, regulative**, etc., **principle.** See the adjectives. — **Short-haul principle**, the principle that the charge for carrying freight should not be higher for a shorter than for a longer distance. See *long haul*, under *long*[1]. — **The currency principle.** See *currency*. — **The principle of excluded middle or third.** See *middle*. — **Transcendental principle.** See *transcendental*. = **Syn. 5.** *Principle, Rule, Precept.* "There are no two words in the English language used so confusedly one for the other as the words *rule* and *principle*. . . . You can make a *rule*; you cannot make a *principle*; you can lay down a *rule*; you cannot, properly speaking, lay down a *principle*. It is laid down for you. You can establish a *rule*; you cannot, properly speaking, establish a *principle*. You can only declare it. *Rules* are within your power, *principles* are not. Yet the mass of mankind use the words as if they had exactly similar meanings, and choose one or the other as may best suit the rhythm of the sentence." (*Helps.*) A *principle* lies back of both *rules* and *precepts*; it is a general truth, needing interpretation and application to particular cases. From a *principle* we may deduce *rules* that we lay imperatively upon ourselves or upon others who are under our authority, and *precepts* that we lay upon those who look to us for instruction. It is a *principle* that "the Sabbath was made for man"; details as to the observance of the Sabbath would be not *principles*, but *rules*, maxims, or *precepts*. See *aphorism*.

Christianity is a spirit, not a law; it is a set of *principles*, not a set of *rules*. . . . Christianity consists of *principles*, but the application of those *principles* is left to every man's individual conscience.

F. W. Robertson, Sermons, Marriage and Celibacy.

Nations pay little regard to *rules* and maxims calculated in their very nature to run counter to the necessities of society. *A. Hamilton*, The Federalist, No. 25.

printer (prin'tėr), *n.* 1. One who prints, impresses, or stamps by impression; a person whose business it is to produce copies or superficial transfers of anything by pressure, as in a press or the like, or by the agency of light on a sensitized surface, as in photography: usually distinguished, when not specific (def. 2), by an adjunct: as, a lithographic *printer*; a plate-*printer*; a calico-*printer*. — 2. printing (prin'ting), *n.* [Verbal n. of *print*, *v.*] 1. In general, the art or process of making copies or superficial transfers by impression; the reproduction of designs, characters, etc., on an impressible surface by means of an ink or a pig-

ment (generally oily) applied to the solid surface on which they are engraved or otherwise formed. This sense is used specifically in typography of the actual taking of impressions by the operation of a press; in other uses, it is generally accompanied by some descriptive term; and in typography itself different methods are discriminated, as type, letterpress, or stereotype printing, color-printing, etc. Type or stereotype printing is done from a surface in high relief; lithographic printing, from the surface of a flat stone; copperplate printing, from inked lines engraved below the surface of a flat plate of copper or steel. The art of printing with ink from blocks of wood was practised in China at an early undetermined date. Silk and linen fabrics were printed from engraved hand-stamps in Europe in the twelfth century; playing-cards and prints of images were impressed on paper in the beginning of the fourteenth century. Calico-printing, oilcloth-printing, and carpet-printing are also distinct arts, each requiring specially made inks and machinery. Printing for the blind, in letters embossed in relief, is the only form of printing done without ink.

2. The art or process of producing printed matter for reading (including illustrations, etc.) by composition and imposition of types, and their subjection when inked to pressure upon paper in a printing-press; the typographic art; typography in the fullest sense. Although documents of a much earlier date exist, which show strong evidence of having been printed in some manner analogous to the modern practice, the history of printing properly begins with the first use of movable molded types, and is accredited to Gutenberg, with the aid of Schoeffer and Fust, of Mainz in Germany, in which city appeared the first book with an authenticated (written) date, 1456. Gutenberg's invention, however, is disputed in favor of his contemporary Coster, of Haarlem in Holland, from whom the former is said to have derived the process. Improvements have since been made in the speed of type-making and in the methods of type-setting, but there has been no radical change in their theory or process. The simple screw hand-press first used for printing from types received no considerable improvement before 1800. Since that date many inventions have been made in printing-machinery, and the collateral arts of stereotyping and electrotyping have been developed. Machines that print from 5,000 to 50,000 copies an hour are to be found in many large cities. The earliest Italian copperplate-print is by Maso Finiguerra, a goldsmith of Florence (1452). Lithography was invented by Aloys Senefelder, of Munich, about 1796; he made prints in 1798, and received a patent in 1800. Typography, also known as letterpress printing, obtains its greatest advantage from the mobility of its types of metal, which can be repeatedly used in endless combinations. Type-printing machinery permits the use, along with types, of engravings on wood, or of stereotype or electrotype plates. In all other kinds of printing, the use of an engraved design in a new combination is not practicable; it can be used only in its first state. Printing comprises two distinct trades — composition, or the art of arranging types, and press work, or the art of getting impressions from composed types. See *compositor*, *pressman*, and *printer*, 2.

3. In *photog.*, the act or art of obtaining a positive photographic picture from a negative, or a picture in which the lights and shades are true to nature from one in which they are reversed. When based upon the properties of a salt of silver, such printing is called *silver-printing*, and similarly with other salts.—4. In *ceram.*, the art of decorating pottery by means of transfers, either by paper printed with mineral colors or by sheets of gelatin printed in oil. By the first plan, the paper is pressed, printed side down, on the ware to make the transfer, and afterward removed by softening in water. By the other plan, the gelatin film or bat simply transfers the oil to the ware, when it can be removed and used again, the oil-print being then dusted with mineral colors.

5. Advertising-bills, posters, dodgers, window-bills, and the like. [Theat. slang.] — **Anastatic printing.** See *anastatic*. — **Artificial or artistic printing.** See *artificial*. — **Bureau of Engraving and Printing.** See *bureau*. — **Chromatic printing.** See *chromatic*. — **Lithographic printing.** See *lithography*. — **Logographic printing**, printing with types bearing whole words or syllables. See *logography*. — **Natural printing**, the taking of an impression from an etched plate as it comes from the bath, for the purpose of showing its exact state. See also *nature-printing*. — **Polychrome printing.** See *polychrome*. — **Solar printing**, in *photog.*, the process or operation of printing or enlarging from a negative by the use of the solar camera. See *copying camera*, under *camera*.

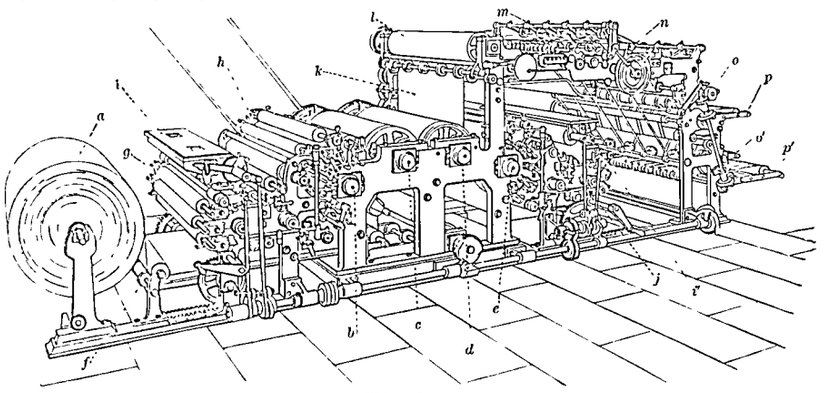
printing-house (prin'ting-hous), *n.* A house or office where letterpress printing is done.

printing-ink (prin'ting-ingk), *n.* Ink used in typographical printing. Its composition, generally speaking, is linseed-oil boiled to a varnish, with coloring matter added to it.



printing-machine (prin'ting-ma-shēn$^{\prime}$), *n.* An apparatus for printing with types or typographic forms, more elaborate than a hand-press; a printing-press adapted for operation at greater speed, and commonly with larger areas of type, than a hand-press; a power-press (properly so called, although with some of the smaller forms manual power may be used). See *printing-press*. Many such machines have been invented. Platen-machines are provided with flat beds for the types, which are impressed by flat platens. Favorite styles of platen-machines for book-work are the Adams press of America and the Napier press of England; for job-work, the Gordon press of America and the Cropper press of England. Cylinder-machines are provided with flat sliding bed-plates for the type-forms, which at intervals are impressed by a rotating cylinder. (See *cylinder-press*.) Rotary machines are provided with cylinders on the curved surface of which the types or plates are fixed, and which are impressed by another rotating cylinder. In some styles of rotary press the central cylinder containing the type is impressed by two or more impression-cylinders, which make a corresponding number of impressions at every rotation. All forms of platen- and cylinder-machines receive, by hand-feeding, cut sheets of paper which are delivered printed usually on one side only, and not folded. Some forms of cylinder-machines are provided with two cylinders for printing a sheet on both sides or in two colors. Web-machines (so called because they use paper in a web-roll, which may be two or more miles long) are provided with cylinders on the curved surface of which the plates are fastened, and which are impressed by other cylinders on both sides. All of these machines are complex, and have an apparatus for cutting and folding sheets and pasting in supplementary single or double leaves, and are largely used for printing daily newspapers. Their performance varies, according to the size of the sheet and other conditions, from 5,000 to 70,000 copies an hour. Nicholson of England received a patent for a cylinder printing-machine in 1790, but his invention was never perfected. Koenig and Bauer in 1811 did the first practical work on their machine, which in 1814 was used to print the London "Times." Early forms of cylinder-machines have been largely improved by Napier of London and Hoe of New York. The web-machine was introduced in 1853, and has received many improvements from Applegath of London, Marinoni of Paris, Hoe of New York, and others. — **Cradle printing - machine.** See *cradle*.

are those in which impression is given by compound levers, and the descent and return of the platen are controlled by coiled springs instead of the screw. Presses of various forms have been devised for special kinds of printing, as in different colors at the same time. The prevalent style of job-presses, for the printing of cards and small sheets, has the type secured to a bed-plate which stands vertically, and the platen swings to and from it on a rocking shaft, or is brought to it by means of a side-lever. They are often worked by a treadle, and hence are also called *treadle-presses*. Their prototype is the Gordon press, invented by George P. Gordon in 1850. — **Chromatic printing-press.** See *chromatic*. — **Copperplate printing-press**, a roller-press used in printing from plates engraved or etched in sunken lines. The original form, still in use, was invented in 1545. It consists of a bed moving on rollers and supporting the plate which is to be printed from. The requisite pressure is obtained by means of a roller above the bed, having a vertical adjustment by means of screws attached to its journal-boxes. The bed is rolled forward to bring the plate and the sheet upon which the drawing is to be transferred beneath the pressing roll. The pressure is adjusted by means of the screws, and the roll turned by a lever-arm attached to its axis, causing the plate and its bed to roll forward beneath it, so as to subject the whole surface of the plate and the sheet which covers it to its action. — **Multicolor printing-press**, a chromatic printing-press for printing simultaneously in bands or stripes of different colors: distinguished from a *chromolithographic press*, which prints in overlaid colors by successive operations.

printing-paper (prin'ting-pā$^{\prime}$pėr), *n.* See *paper*.

printing-press (prin'ting-pres), *n.* A machine for taking impressions from an inked surface upon paper. A press that prints from stone is always specified as a lithographic press; a press that prints from etched or engraved copperplates, as a copperplate-press. Presses for typographic printing are broadly divided into three classes — hand-presses, job presses, and power-presses. Those of the last class are treated under *printing-machine*. The early hand-press was largely of wood. A stone was provided as a bed for the form of types, and iron for minor pieces only. Impression was made by the direct action of a screw on the platen or pressing surface, which covered only one half of the bed-plate of stone. The first notable improvement was that of Stanhope of England, who in 1798 made a hand-press entirely of iron, with a platen that fully covered the bed-plate. Many improvements have followed. The hand-presses now preferred

prior (prī'ȯr), *n.* [< ME. *priour*, *preyour* = D. *prioor* = MLG. *prior*, *prier* = MHG. *prior*, G. *prior* = Sw. Dan. *prior*, < OF. *priour*, *prieur*, F. *prieur* = Sp. Pg. *prior* = It. *priore*, < ML. *prior*, a prior, lit. superior, < L. *prior*, former, superior: see *prior*, *a.*] A superior officer; a superior. Specifically – (*a*) *Eccles.*, an official in the monastic orders next in dignity and rank to an abbot. Before the thirteenth century he seems to have been called *proræ* (præpositus) or *prælate* (prælatus), and *prior* seems to have meant any superior or senior. If in an abbey, and an assistant of the abbot, he is called a *claustral prior*; if the superior of a priory – that is, of a monastery of lower than abbatial rank – he is called a *conventical* or *conventual prior*. The superiors of the houses of regular canons were always called *priors*, and the commandants of the priories of the military orders of St. John of Jerusalem, of Malta, and of the Templars were called *grand priors*. See *hegumen*.

> The *prior* of Durham, modest as the name might sound, was a greater personage than most abbots.
> *Rom. Cath. Dict.*

(*b*) Formerly, in Italy, a chief magistrate, as in the mediæval republic of Florence.

> The *Priors* of the [Florentine] Arts.
> *C. E. Norton*, Church-building in Middle Ages, p. 193.
>
> In 1300 we find him [Dante] elected one of the *priors* of the city. *Lowell*, Among my Books, 2d ser., p. 10.

= Syn. *Abbot*, *Prior*. See def. (*a*).

priorate (prī'ȯr-āt), *n.* [= F. *prieuré* = Sp. *priorato* = Pg. *priorado*, *priorato* = It. *priorato* = D. *prioraat* = G. Sw. Dan. *priorat*, < ML. *prioratus*, the office of a prior, < *prior*, a prior: see *prior*, *n.*] 1. The rank, office, or dignity of prior, in any sense of that word.

> Dante entered on his office as one of the priors of the city; and in that *priorate*, he himself declared, all the ills and calamities of his after-years had their occasion and beginning.
> *C. E. Norton*, Church-building in Middle Ages, p. 194.

2. The period during which a prior holds office; priorship.

> An eulogy on Walkelin, bishop of Winchester, and a Norman, who built great part of his stately cathedral, as it now stands, and was bishop there during Godfrey's *priorate*.
> *T. Warton*, Hist. Eng. Poetry, Dis., ii.

prioress (prī'ȯr-es), *n.* [< ME. *prioresse* = D. *priores*, < OF. *prioresse* = Pg. *prioreza* = MLG. *priorisse*, *priorsche*, *priersche*, < ML. *priorissa*, a prioress, fem. of *prior*, prior: see *prior*, *n.*] A female prior, having charge of a religious house; a woman who is the coadjutor of and next in rank to an abbess.

By her proud mien and flowing dress,
Is Tynemouth's haughty *Prioress*.

priority (prī-or'i-ti), *n.* [< F. *priorité* = Sp. *prioridad* = Pg. *prioridade* = It. *priorità*, < ML. *priorita(t-)s*, < L. *prior*, former: see *prior*, *a.*] 1. The state of being prior or antecedent, or of preceding something else: as, *priority* of birth: opposed to *posteriority*.

As there is order and *priority* in matter, so is there in time. *Bacon*, Advancement of Learning, ii. 345.

2. Precedence in place or rank; the having of certain rights before another.

Follow Cominius; we must follow you;
Right worthy you *priority*. *Shak.*, Cor., i. 1. 251.

After his [Austin's] decease there should be equalitie of honour betwixt London and Yorke, without all distinction of *prioritie*. *Foxe*, Martyrs, p. 156, an. 1070.

3. In *law*, a precedence or preference, as when one debt is paid in *priority* to others, or when an execution is said to lose its *priority* by the neglect of the party to enforce it.—4. Apriority.—Syn. *Priority*, *Antecedence*, *Precedence*, *Preeminence*, *Predominance*, *Preference*, *Superiority*, *Supremacy*. *Priority* is the state or fact of coming first in order of time; what little use it has beyond this meaning is only a figurative extension. *Antecedence* is strictly *priority*, without any proper figurative use. *Precedence* may mean *priority*, but generally means the right to go or come first, the privilege of going before another: as, the question of *precedence* among sovereigns or ambassadors makes great trouble, because the dignity of the nations represented is supposed to be at stake. *Preeminence* is, figuratively, height by nature above all others, generally in some one respect: as, the *preeminence* of Shakspere as a dramatist. *Predominance* is superior and dominating power or influence: as, the *predominance* of a certain faction; figuratively, the *predominance* of light or shade or a particular color in a certain picture. *Preference* is the putting forward of a person or thing by choice, on the ground of worthiness, or on account of the taste, fancy, or arbitrary will of the one preferring: as, to give the *preference* to Milton over Dante. *Superiority* may refer to nature or to given or achieved position over others; it differs from *supremacy* as the comparative differs from the superlative degree: as, the *superiority* of the appearance of certain troops; the *superiority* of the dairy-products of a certain region; *superiority* to one's circumstances; *supremacy* on the land and *supremacy* on the sea do not always go together. See *previous*.

priorly (prī'or-li), *adv.* [< *prior*, *a.*, + *-ly*2.] Antecedently.

prism (prizm), *n.* [= F. *prisme* = Sp. Pg. It. *prisma* = D. G. Sw. Dan. *prisma*, < LL. *prisma*, a prism (in geom.), < Gr. *πρίσμα*, a prism (in geom.), lit. something sawed (as a block of wood), also sawdust, < *πρίειν*, *πρίζειν*, saw.] 1. In *geom.*, a solid whose bases or ends are any similar, equal, and parallel plane polygons, and whose sides are parallelograms. Prisms are triangular, square, pentagonal, etc., according as the figures of their ends are triangles, squares, pentagons, etc.

Triangular Prism.

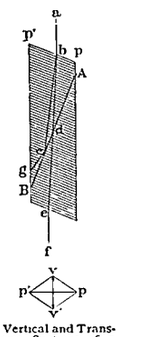
Marble-Worker, § 152.

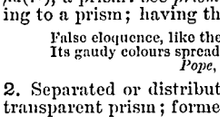
Specifically—2. An optical instrument consisting of a transparent medium so arranged that the surfaces which receive and transmit light form an angle with each other: usually of a triangular form with well-polished sides, which meet in three parallel lines, and made of glass, rock-salt, or quartz, or a liquid, as carbon disulphid, contained in a prismatic receptacle formed of plates of glass. A ray of light falling upon one of the sides of a prism is refracted (see *refraction*) or bent from its original direction at an angle depending upon its own wave-length, the angle of incidence, the angle of the prism, and the material of which the prism is made. This angle of deviation, as it is called, has a definite minimum (minimum deviation) value when the angle of incidence is equal to the angle of emergence.



Glass Prism upon Adjustable Stand.

The angle of deviation increases as the wave-length of the light-ray diminishes; consequently, if a pencil of white light falls upon the prism, the different rays are separated or dispersed, and a spectrum is the result. (See *spectrum*.) Prisms are hence used in spectrum analysis to decompose light, so that the rays of which it is made up may be examined.

The beams that thro' the Oriel shine
Make *prisms* in every carven glass.
Tennyson, Day-Dream, The Sleeping Palace.



3. In *crystal.*, a form consisting of planes, usually four, six, eight, or twelve, which are parallel to the vertical axis. If the planes intersect the lateral axes at the assumed unit distances for the given species, it is called a *unit prism*; otherwise it may be described, according to the position of the planes, as a *macroprism*, *brachyprism*, *orthoprism*, or *clinoprism*. In the triclinic system the form includes two planes only, and it is hence called a *hemiprism*. In the tetragonal system the unit prism is sometimes called a *protoprism*, or prism of the first order, and the diametral prism, whose planes are parallel to a lateral axis, a *deuteroprism*, or prism of the second order; these names are also used in an analogous manner in the hexagonal system.

4. In canals, a part of the water-space in a straight section of a canal, considered as a parallelepiped.—5. In *weaving*, same as *pattern-box* (*b*).—**Achromatic prism**, a prism through which an incident beam of light is refracted into a new direction without color. It consists of a combination of two prisms, made of two different transparent substances of unequal dispersive powers, as flint-glass and crown-glass.—**Amici's prism**, in *microscopy*, a form of illuminator consisting of a prism having one plane and two lenticular surfaces, so that it serves at once to concentrate the rays and to reflect them obliquely upon the object. It is supported upon an adjustable stand.—**Bisulphid prism**. See *bisulphid*.—**Diametral prism**. See *diametral planes*, under *diametral*.—**Diatom prism**, a prism used as an attachment to a microscope to give the oblique illumination favorable for observing very fine lines or markings, as those on the shells of diatoms.—**Double-image prism**, in *optics*, a prism of Iceland spar which yields two images of like intensity, but polarized in planes at right angles to each other.—**Equilateral prism**, a prism having equal sides, used as an attachment to a microscope to illuminate the object. It acts on the principle of total reflection.—**Erecting prism**, a prism placed between the two lenses of the eyepiece, and serving to erect the inverted image of a compound microscope.—**Natchet's prism**. (*a*) In *microscopy*, an erecting prism. (*b*) A form of illuminator consisting of a prism with two convex surfaces, by which the light is brought to a focus upon the object.—**Nicol prism**, or *nicol*, a prism of Iceland spar (calcite), used when polarized light is required: named from its inventor, William Nicol, of Edinburgh, who first described it in 1828. The common form is constructed from an oblong cleavage piece, first by grinding two new faces at the ends (as *pp'*) inclined about 68° to the vertical edges, and then cementing the halves together by Canada balsam in the line *AB*. The ordinary ray now suffers total reflection at *c*, and is absorbed by the blackened sides at *g*, while the extraordinary ray, polarized with vibrations parallel to the shorter diagonal of the cross-section, emerges at *e*. Modified forms of the prism, accomplishing the same end, have been devised in recent years (often called *nicols* also), which are much shorter, and hence have the advantages of giving a larger field in the microscope and less loss of light by absorption, together with an important saving of the material; one of these is the Razumovsky prism.—**Prism battery**, a Leclanché battery in which a pair of compressed prisms, containing all the materials commonly used in the porous cup, is employed in place of the latter.—**Reversing prism**, a small obtuse-angled isosceles prism (*p* in the cut) of flint-glass, placed between the eye-lens of a positive eyepiece *e* and the eye, with its longest side parallel to the optical axis of the eyepiece. It inverts the image viewed through the eyepiece, and when it is made to rotate around the optical axis the image also appears to turn, so that any line in it can be made vertical or horizontal at pleasure. This enables the observer to avoid, or to eliminate, certain errors of measurement which depend upon the apparent position of the object.—**Right-angle prism**, a prism attached to a microscope-stand to throw light upon an object. It is so made that it can rotate on a horizontal or vertical axis, so as to throw light as required.—**Wenham prism**, in a binocular microscope, a quadrilateral prism used to refract part of the light-rays from the object up the second tube to its eyepiece.

Vertical and Transverse Sections of a Nicol Prism.

pp', direction of terminal face of prism; *AB*, direction of surface by which the parts are cemented together; *bcg*, path of ordinary ray; *cdef*, path of extraordinary ray; *vv'*, direction of vibration plane in shorter diagonal of transverse section (*pp'* being longer diagonal, cf. above).

See *color* and *spectrum*.—**Prismatic compass**, a compass held in the hand when used, and so arranged that by means of a prism the graduations can be read off at the same time that the object sighted is seen through the sight-vane. It is used for taking bearings in sketching ground for military purposes, and for filling in the interior details of rough surveys.—**Prismatic crystal**, a crystal having a prismatic form.—**Prismatic planes**, in *crystal.*, planes parallel to the vertical axis of the crystal.—**Prismatic powder**. See *powder*.

Prismatic Compass.

a, floating card 3 inches in diameter; at the N point and numbered entirely around the circle, 360°; *b*, vertical sight vane with central vertical wire *d*; *c*, prism. 6†. *pl.* The private parts. *Abp. Abbot.*—7. In *law*: (*a*) That relation between different interests of several persons in the same lands which arises under feudal tenures. All the various estates, less than a fee simple absolute, were regarded as so many parts of entire title, and the persons among whom such partial interests were distributed were said to stand in privity or in privity of estate to each other. If the interests belonging to one of such persons devolved either by act of law, as in the case of his death intestate, or by act of the parties, as in the case of a conveyance, upon a third person, that person was thereby brought into privity with him and the others. In the former case he was said to be *privy in law*, in the latter case *privy in deed*, each of these being only species of *privies in estate*. Upon the same principle, whenever several lesser estates were carved out of a larger, as by grant of a qualified interest or life estate leaving a remainder or reversion in the grantor, the parties were termed *privies*. (*b*) More loosely, since the abrogation of tenure, any joint, separate, or successive interest affecting the same realty is deemed to constitute a privity between the parties in interest. Thus, if B inherits land from A, there is privity of estate between them, and if C inherits the same land from B, the privity extends to him, so that B and C may be both bound in respect to the land by whatever bound A. (*c*) In the law of obligations, the mutual relationships between contractor and contractee, and either of them and a third person claiming under the contract, which result from the existence of the contract. Thus, if A gives his note to B, and B separately gives his note to C, there is privity of contract between A and B, and also between B and C, but none between A and C. But if A gives his note to B, and B indorses it over to C, there is privity of contract among all. (*d*) In the law of contracts and torts, the legal relation consequent on joint or common knowledge and concurrence, particularly in respect to a breach of contract, a tort, or a wrong.—**Privity of tenure,** the relation subsisting between a lord and his immediate tenant.

proa (prō'ä), *n.* [Also *prau*, *prahu*, and formerly *proe*, *prow*, also *praw* (as Malay); < Malay *prāu*, a proa (a general term for all vessels between a canoe and a square-rigged vessel).] A kind of Malay vessel remarkable for swiftness, formerly much used by pirates in the Eastern Archipelago. Proas are found chiefly within the region of the trade-winds, to which by their construction they are peculiarly adapted; for, being formed with stem and stern equally sharp, they never require to be turned round in order to change their course, but sail equally well in either

direction. The lee side is flat and in a straight line from stem to stern, and acts as a lee-board or center-board; but the weather side is rounded as in other vessels. This shape, with their small breadth, would render them very liable to heel over, were it not for the outrigger, which is used on either side or on both. The proa is fastened together with coir yarns, is extremely light, and carries an enormous triangular sail. Also called *flying proa*.

They [the Dutch] have *Proes* of a particular neatness and curiosity. We call them Half-moon *Proes*, for they turn up so much at each end from the water that they much resemble a Half-moon with the Horns upwards.

probabiliorism (prō-ba-bil'i-or-izm), *n.* [< NL. *probabiliorismus*, < L. *probabilior*, compar. of *probabilis*, probable: see *probable*.] In *Rom. Cath. theol.*, the doctrine that it is lawful to act in a certain manner only when there is a more probable opinion in favor of such action than against it, so that when there are two equally probable opinions, one for and the other against liberty of action, it is not lawful to accept the former opinion and follow one's inclinations. See *probabilism*, *probabilist*.

probabiliorist (prob-a-bil'i-or-ist), *n.* [< NL. *probabiliorista*, < L. *probabilior*, compar. of *probabilis*, probable: see *probable*.] One who holds to the doctrine of probabiliorism.

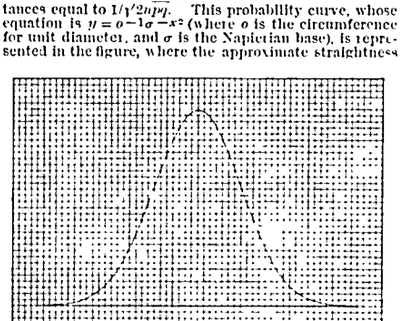
probabilism (prob'a-bil-izm), *n.* [= F. *probabilisme* = Sp. Pg. It. *probabilismo* = G. *probabilismus*, < NL. *probabilismus*, < L. *probabilis*, probable: see *probable*.] In *Rom. Cath. theol.*, the doctrine that when there are two probable opinions, each resting on apparent reason, one in favor of and the other opposed to one's inclinations, it is lawful to follow the probable opinion which favors one's inclination. See *probabiliorism*, *probabilist*.

The working of the principle known as *Probabilism*. The meaning of this principle . . . is simply this: when a doubt arises as to the binding force of some divine or human precept in any given case, it is permissible to abandon the opinion in favour of obedience to the law—technically known as "safe" (tuta) opinion—for that which favours non-compliance, provided this laxer opinion be 'probable.' And by "probable" is meant any judgment or opinion based on some reasonable grounds, though with some doubt that the opposite view is perhaps the true one (Gury, Theol. Mor., I. n. 51).

Encyc. Brit., XIV. 636.

probabilist (prob'a-bil-ist), *n.* [= F. *probabiliste* = Sp. Pg. It. *probabilista* = G. *probabilist*, < NL. *probabilista*, < L. *probabilis*, probable: see *probable*.] 1. One who holds the doctrine of probabilism.—2. One who maintains that certainty is impossible, and that probability alone is to govern faith and practice.



probability (prob-a-bil'i-ti). *n.*; pl. *probabilities* (-tiz). [= F. *probabilité* = Sp. *probabilidad* = Pg. *probabilidade* = It. *probabilità*, < L. *probabilita(t-)s*, probability, credibility, < *probabilis*, probable, credible: see *probable*.] 1. The state or character of being probable; likelihood; appearance of truth; that state of a case or question of fact which results from superior evidence or preponderation of argument on one side, inclining the mind to receive that as the truth, but leaving some room for doubt.

> Thus, first traditions were a proof alone,
> Could we be certain such they were, so known;
> But, since some flaws in long descent may be,
> They make not truth, but *probability*.
> *Dryden*, Religio Laici, l. 345.

Probability is nothing but the appearance of such an agreement or disagreement, by the intervention of proofs whose connection is not constant, . . . but is or appears for the most part to be so. . . . In which case the foundation of his assent is the *probability* of the thing, the proof being such as for the most part carries truth with it. . . . So that that which causes his assent to this proposition is the wonted veracity of the speaker in other cases.

Locke, Human Understanding, IV. xv. § 1.

2. Quantitatively, that character of an argument or proposition of doubtful truth which consists in the frequency with which like propositions or arguments are found true in the course of experience. Thus, if a die be thrown, the probability that it will turn up ace is the frequency with which an ace would be turned up in an indefinitely long succession of throws. It is conceivable that there should be no definite probability: thus, the proportion of aces might so fluctuate that their frequency in the long run would be represented by a diverging series. Yet even so, there would be approximate probabilities for short periods of time. All the essential features of probability are exhibited in the case of putting into a bag some black beans and some white ones, then shaking them well and finally drawing out one or several at random. The beans must first be shaken up, so as to assimilate or generalize the contents of the bag; and a similar result must be attained in any case in which probability is to have any real significance. Next, as each of the beans must be drawn out at random—that is, so as not to be voluntarily subjected to any general conditions additional to those of the course of experience of which they form a part. Thus, out-of-the-way ones or uppermost ones must not be particularly chosen. This random choice may be effected by mechanically, if desired. If, now, a great number of single beans are so taken out and replaced successively, the following phenomenon will be found approximately true, or, if not, a prolongation of the series of drawings will render it so: namely, that if the whole series be separated into parts of two fixed numbers of drawings, say into series of 100 and of 10,000 alternately, then the average proportion of white beans among the sets of 100 will be nearly the same as the average proportion among the sets of 10,000. This is the fundamental proposition of the theory of probabilities—we might say of logic—since the accuracy of all real inference rests upon it. The greater the frequency with which a specific event occurs in the long run, the stronger is the expectation that it will occur in a particular case. Hence, probability has been defined as the degree of belief which ought to be accorded to a problematical judgment; but this *conceptualistic probability*, as it is termed, is strictly not probability, but a sense of probability. Probability may be measured in different ways. The conceptualistic measure is the degree of confidence to which a reason is entitled, it is used in the mental process of balancing reasons pro and con. The conceptualistic measure is the logarithm of another measure called the *odds*—that is, the ratio of the number of favorable to the number of unfavorable cases. But the measure which is most easily guarded against the fallacies which beset the calculation of probabilities is the ratio of the number of favorable cases to the whole number of equally possible cases, or the ratio of the number of occurrences of the event to the total number of occasions in the course of experience. This ratio is called the *probability* or chance of the event. Thus, the probability that a die will turn up ace is $\frac{1}{6}$. Probability *zero* represents impossibility; probability *unity*, certainty. The fundamental rules for the calculation of probabilities are two, as follows: *Rule I.* The probability that one or the other of two mutually exclusive propositions is true is the sum of the probabilities that one and the other are true. Thus, if $\frac{1}{6}$ is the probability that a die will turn up ace, and $\frac{1}{6}$ is the probability that it will turn up an even number, then, since it cannot turn up at once an ace and an even number, the probability that one or other will be turned up is $\frac{1}{6} + \frac{1}{6} = \frac{2}{3}$. It follows that if p is the probability that any event will happen, $1 - p$ is the probability that it will not happen. *Rule II.* The probability of an event multiplied by the probability, if that event happens, that another will happen, gives as product the probability that both will happen. Thus, if a die is so thrown that the probability of 6 is not being found is $\frac{5}{6}$, then the probability of its being found ace up is $\frac{5}{6} \times \frac{1}{6} = \frac{5}{36}$. If the probability that a certain man will reach the age of forty is p, and the probability, when he is forty, that he will then reach sixty is q, then the probability now that he will reach sixty is pq. If two events A and B are such that the probability of A is the same whether B does or does not happen, then, also, the probability of B is the same whether A does or does not happen, and the events are said to be *independent*. The probability of the concurrence of two independent events is the product of their separate probabilities. The probability that a general event, whose probability on each one of n occasions is p, should occur just k times among these n occasions, is equal to the term containing p^k in the development of $(p + q)^n$, where $q = 1 - p$. Thus, suppose the event is the appearance of head when a coin is tossed up, so that $p = q = \frac{1}{2}$, and the coin be tossed up six times. Then the probabilities of 0, 1, 2, 3, 4, 5, 6 heads respectively are $\frac{1}{64}$, $\frac{6}{64}$, $\frac{15}{64}$, $\frac{20}{64}$, $\frac{15}{64}$, $\frac{6}{64}$, $\frac{1}{64}$. The most probable value of k is that whole number next less than $(n + 1)p$, unless this be itself a whole number, when it is equally probable. When the number of trials is large, the probabilities of the different numbers of occurrences of the given event are proportional to areas included between the so-called probability curve, its asymptote, and ordinates at successive distances equal to $1/\sqrt{2npq}$. This probability curve, whose equation is $y = \sigma - 1\sigma - x^2$ (where σ is the circumference for unit diameter, and σ is the Napierian base), is represented in the figure, where the approximate straightness

Probability Curve

of the slope will be remarked. If it is desired to ascertain the probability of the occurrence from k_1 to k_2 times inclusive in n trials of an event whose probable occurrence at each trial is p, the approximate value is the area included between the probability curve, the asymptote, and the two ordinates, for which

$$x = \frac{k_1 - (n+1)p}{\sqrt{2npq}} \text{ and } x = \frac{k_2 + 1 - (n+1)p}{\sqrt{2npq}}.$$

Twice the quotient of the area are given in tables of probabilities, and tables of the kind for this purpose are called tables of the probability integral. The chief practical application of probability is to the theory of errors, and the probable error is a quantity of frequent occurrence as the result in the long run. The theory of probability is not regarded as the highest of the physical sciences.

3. Anything that has the appearance of reality or truth.

Is the report and the oath so splendent to bail all that better judgments than ours might have been persuaded they contain more than probabilities.

Quoted in *Capt. John Smith's* Works, I. 115.

4. A statement of what is likely to happen; a forecast: applied in the plural by Cleveland Abbe to his daily weather-predictions in Cincinnati in 1869, and subsequently adopted by General Myer to designate the official weather-forecasts of the United States Signal Service. The same term had been similarly used by Leverrier in Paris since 1859.

The whole system [of meteorological predictions] is excellently organized and very extensive, the official publications embrace the *probabilities* and thereto call the weather maps. *Pop. Sci. Mo.*, XXIX. 746.

Antecedent probability. See *antecedent*. **Balance of probabilities.** See *balance*. **Calculus of probability**, a branch of mathematics teaching how to calculate probabilities by general methods. **Curve of probability.** See above.—**Inverse probability**, the probability of a hypothesis as deduced from the comparison of its consequences with observation. Thus, the following is a familiar problem of inverse probability. Suppose a bag contains a series of tickets numbered consecutively from 1 up. Suppose a ticket is drawn at random, and its number is 17; what is the most probable number of tickets in the bag? The best opinion concerning inverse probability seems to be that it is altogether fallacious, unless the antecedent probability of the hypothesis is known. Some writers hold that the probability of a proposition about which we are completely ignorant is $\frac{1}{2}$, others hold that it is indeterminate.—**Local probability.** *See local.*—**Old Probabilities.** See *old*.

probable (prob'a-bl), *a.* and *n.* [< F. *probable* = Sp. *probable* = Pg. *provavel* = It. *probabile*, < L. *probabilis*, that may be proved, credible, < *probare*, test, examine: see *probe*, *prove*.] I. *a.* 1†. Capable of being proved; provable.

Probable cause. See *cause*. **Probable error**, in *astron.* and *physics*. When the value of any quantity or element has been determined by means of a number of independent observations every one liable to a small amount of accidental error, the determination will also be liable to some uncertainty, and the *probable error* is the quantity which is such that there is the same probability of the difference between the determination and the true absolute value of the thing to be determined exceeding or falling short of it. But it is to be remarked that, as so defined, the constant error belonging to all observations of the given series is not included in the probable error.—**Probable evidence**, evidence distinguished from demonstrative evidence in that it admits of degrees and of all variety of them, from the highest moral certainty to the very lowest presumption.—**Probable inference.** See *inference*.—**Probable proposition.** See *proposition*.

From this solution the silver is precipitated by means of copper.—**Barff's process,** a method of protecting the surface of iron from rust by forming upon it a thin film of magnetic oxid. It is done by subjecting it at a red heat to the action of superheated steam.—**Basic process.** See *basic.*—**Basilar process.** See *basilar.*—**Basipterygoid processes.** See *basipterygoid.*—**Beer process,** in *photog.* See *beer*[1].—**Bessemer process,** a method, invented by Bessemer, of decarburizing cast-iron. See *patio process.*—**Chenot process,** a process, invented by the French metallurgist Chenot, for producing cast-steel. Wrought-iron in the form of a metallic sponge is first obtained directly from the ore by cementation with charcoal. This iron is then carburized by being impregnated with some liquid substance rich in carbon, then torrified, and finally melted in crucibles, as in the ordinary method of manufacturing cast-steel.—**Chlorination, chlorin, ciliary, clay, clinoid, cochleariform process.** See the qualifying words.—**Collodion process,** in *photog.* See *collodion.*—**Condyloid process.** Same as *articular process of the lower jaw.*—**Coracoid, coronoid, costal process.** See the adjectives.—**Cordurié's process,** a method of dezincification, by the use of superheated steam, of lead from which the silver has been separated by the Parkes process.—**Creosoting process,** the application of creosote to wood (especially telegraph-poles) for its preservation.—**Direct process.** See *bloomery.*—**Dry process.** (*a*) In *photog.,* the use of dry plates or films; specifically, the use of gelatinobromide emulsions as a sensitive coating for plates or films which are used in a dry state. See *photography.* (*b*) In *fish-culture,* a process of fecundating spawn, invented by V. P. Vrasski. It differs from the *moist process* by requiring two vessels, one for the spawn, which is placed in it without water, and the other for the milt, to which water is added to moisten the eggs. By the dry process, scarcely one per cent. of the eggs escape fecundation, while in the moist method ten or twelve per cent. of the spawn may be lost. (*c*) In *assaying.* See *assaying.*—**Due process of law.** See *due*[1].—**Eckart's process,** a method of preserving meats, game, fish, etc., by means of a solution of 1,240 parts salt, 10 parts saltpeter, and 25 parts salicylic acid in 8,725 parts of clean water, applied under a pressure of 180 to 200 pounds per square inch.—**Ensiform process.** Same as *metasternum.*—**Ethmoidal process,** a small projection on the posterior superior border of the turbinate bone for articulation with the uncinate process of the ethmoid.—**Executory process.** See *executory.*—**Falciform process.** Same as *falx cerebri* (which see, under *falx*).—**Fallacy of an illicit process.** See *fallacy.*—**Final process,** the writ of execution used to carry the judgment into effect.—**Floccular process,** the flocculus.—**Foreign Process Acts.** See *foreign.*—**Fox-Talbot process.** Same as *Fox-type,* 1.—**Frontonasal, galvanoplastic, gelatin, geniculate, Ingrassian process.** See the qualifying words.—**Hamular process,** (*a*) Of the lacrymal bone, a hook-like projection at the lower extremity, curving forward in the lacrymal notch of the maxilla. Also called *paracondyloid process.*—**Parkes process,** a method of separating silver from lead by fusion with metallic zinc. When a molten mixture of these two metals is allowed to cool, the zinc separates and solidifies first, forming a crust on the other metal. If the lead contains silver, this is concentrated in the solidified crust of zinc, from which it may afterward be separated by distillation.—**Parotic process.** See *parotic.*—**Patera process.** See *Von Patera process,* below.—**Patio process** [Sp. *patio,* an open space], in *metal.,* a method of obtaining the silver from argentiferous ores by amalgamation, extensively practised in Mexico and South America. It is suited for ores in which the silver is present in the form of simple or complex sulphids, without a large percentage of blende or galena, or more than three or four per cent. of copper pyrites. In this process the ore, ground by arrastres, is mixed with common salt, roasted copper pyrites (called *magistral*), and quicksilver. The whole mass is thoroughly mixed, usually by being trodden by mules, the result being that the silver becomes amalgamated with the quicksilver, and can then be easily separated. The mixing (as indicated by the name) takes place on large level floors in the open air.—**Pattinson process,** in *metal.,* a method of desilverizing lead, in general use in the treatment of argentiferous lead, and capable of being profitably employed even when the precious metal is present in the lead in so small quantity as two or three ounces to the ton of the baser metal. The process depends on the fact that melted lead containing silver solidifies gradually in cooling, small particles like crystals separating from the liquid mass, which latter is much richer in silver than the other part—the part which solidifies or crystallizes first yielding up a large part of its silver to that part of the lead which remains fluid. By several repetitions of the operation, the remaining lead becomes at last so enriched with silver that this metal can be easily and profitably separated. The process, which is one of great importance in the metallurgic treatment of argentiferous galena, was the invention of Hugh Lee Pattinson of Alston in Cumberland, and was first applied on a scale of some magnitude in 1833. Before this invention silver had always been separated from lead (these two metals being almost always found associated together in nature) by cupellation, through which process a proportion of silver less than about eight ounces to the ton of lead could not be separated with profit. The process is sometimes called *pattinsonization.*—**Pectineal, phalangeal, photolithographic process.** See the adjectives.—**Photogelatin process,** in *photog.,* any process in which gelatin plays an important part, as in the ordinary gelatinobromide dry plates and films.—**Plaster process.** See *plaster.*—**Plattner's process,** a method of separating gold from pyrites by the employment of chlorin gas, by which the gold is converted into a soluble chlorid, which can then be washed out with water, and precipitated by sulphureted hydrogen in the form of a sulphuret, from which combination the precious metal is easily obtained. See *chlorination.*—**Polychromatic, postauditory, postfrontal, post-tympanic, prepubic process.** See the adjectives.—**Precipitation process.** Same as *iron-reduction process.*—**Process acts,** United States statutes of 1789 and 1792 (1 Stat. 93, 275), the first requiring the writs, executions, and other processes of the United States courts in suits at law to conform to those used in the supreme courts of the several States where such courts were held, except as to their style and teste. The second, in effect, reenacted the first, but allowed the courts or the Supreme Court of the United States by rule to make such alterations or additions as might seem expedient, and regulated the fees of court-officers, etc.—**Process caption.** See *caption.*—**Process of augmentation.** See *augmentation.*—**Process work,** any form of relief-printing plate made by photographic or etching processes, and not by cutting with a graver. See *photo-process.*—**Prosternal, pterygoid, etc., process.** See the adjectives.—**Pyramidal process.** Same as *tuberosity of the palate-bone.*—**Russell's process,** a modification of the Von Patera process for the separation of silver from its ores. The peculiarity of the process depends on the fact that a solution of thiosulphate of copper and soda has a powerful decomposing influence on the sulphureted, antimoniureted, and arseniureted combinations of silver. The roasted ore is first lixiviated with sodium thiosulphate to dissolve the silver chlorid, and afterward with copper thiosulphate. This latter solvent is called the "extra solution," and by its use an additional amount of silver is saved, which would otherwise have been lost in the tailings.—**Short process of malleus,** a small conical eminence at the root of the manubrium. Also called *processus brevis, obtusus, externus, cuneiformis,* or *tuberculum mallei.*—**Siemens-Martin process.** See *steel.*—**Siemens process.** See *steel.*—**Solvay process.** See *soda.*—**Sphenoidal process,** the posterior of the two processes surmounting the vertical plate of the palate-bone. It represents a part of the bone inclosing a foramen in carnivorous animals.—**Thomas-Gilchrist process.** Same as *basic process.*—**To obstruct process.** See *obstruct.*—**Trustee process.** See *garnishment,* 2 (*b*).—**Turbinate process.** (*a*) Superior, a short sharp margin of the ethmoid overhanging the superior meatus. (*b*) Of the temporal, a flattened plate of bone on the under surface of the petrous portion, immediately back of the glenoid fossa, and partly surrounding the styloid process at its base.—**Vermiform process,** the elevated median portion or lobe between the hemispheres of the cerebellum—that portion on the upper surface being known as the *superior,* that on the under surface the *inferior.*—**Von Patera process,** a method of separating silver from its ores, after a chloridizing roasting, by means of a solution of hypophosphite of soda or lime, which takes up the chlorid of silver, from which solution the metal can be precipitated by an alkaline sulphuret.—**Washoe process,** in *metal.* See *pan*[1], 3.—**Wet process,** in *photog.,* the collodion process.—**Ziervogel's process,** the separation of silver from the sulphate by lixiviation with hot water containing some sulphuric acid. It is used in the treatment of argentiferous copper mattes in which the silver has been transformed into the sulphate by a peculiar kind of roasting. This process is one of very limited application, as great skill is required for the management of the roasting, and but few silver ores can be profitably treated by the method.—**Zygomatic process,** a horizontal bar, directed forward from the squamous part of the temporal bone, and articulating in front with the malar. Also called *zygoma.*=**Syn.** *Process, Proceeding, Procedure, Operation.* In this connection *process* applies to a way of doing something by rule or established method: as, the Bessemer *process;* the *process* of drilling an artesian well; a legal *process. Proceeding* expresses a complex action making a whole: as, it was a very strange *proceeding.* Jefferson and Cushing, in their manuals of parliamentary *procedure,* use *proceeding,* perhaps as a participial noun, where *procedure,* being more exact, would be the better word. *Procedure* applies to a way of doing things formally; a legal *proceeding* is a thing done legally; a legal *process* is a legal form gone through for the attainment of a definite purpose; legal *procedure* is the way of doing things in the administration of law, as in the courtroom; a legal *procedure* is a less desirable form of expression for a legal *proceeding. Operation* may be used for the way in which a thing works or operates: as, the *operation* of a nail-making machine; it is rarely used thus of personal activity, except in a bad sense: as, the *operations* of a gang of thieves. See *act, v. i.*

Thus, 72 is the *product* of 8 multiplied by 9; and $dy\,dx$ is the *product* of y multiplied by the operator $d\,dx$. The quantities multiplied together are usually termed *factors*. *Product* results from *multiplication*, as *sum* does from *addition*. Of these only *production* may mean the act of producing. As standing for the thing or things produced, *produce* applies now almost exclusively to the raw *products* or yield of land: as, to bring fresh *produce* to market. Where Jonathan Edwards spoke of regarding "all free actions as the *produce* of free choice," we should speak now of regarding them as the *products* of free choice, or, better, as its effects. There is a lingering use of *produce* in such expressions as "the *produce* of a tax," but better now the *product*, or, still better, the proceeds. The word is always collective: we do not speak of *a produce*. *Product* and *production*, on the other hand, are particular. *Product* is the most general of the three words, but expresses the result of some operation, generally, but not necessarily, physical: as, the apple is especially an American *product*; Great Britain exports chiefly manufactured *products*. Thus, the word may apply to almost anything where emphasis is laid upon the fact of its being produced by some cause, especially by some cause that is named; but, apart from this, the word is applied chiefly to things having a material value, covering *produce*, manufactures, etc. *Production* applies now almost exclusively to the visible results of the operation of mind or the handiwork of art, as a book, a poem, an oration, a statue, a painting, a piece of needlework—the act or fact of producing being only subordinate in mind. *Product* is also a technical word of mathematics, but the others are not.

The first three words express offenses, amounting almost or quite to outrages, against the religious sentiment, in connection with places, days, etc., taking off their sacred character. 3. The calling or occupation which one professes to understand and to follow; vocation; specifically, a vocation in which a professed knowledge of some department of science or learning is used by its practical application to affairs of others, either in advising, guiding, or teaching them, or in serving their interests or welfare in the practice of an art founded on it. Formerly theology, law, and medicine were specifically known as *the professions*; but, as the applications of science and learning are extended to other departments of affairs, other vocations also receive the name. The word implies professed attainments in special knowledge, as distinguished from mere skill; a practical dealing with affairs, as distinguished from mere study or investigation; and an application of such knowledge to uses for others as a vocation, as distinguished from its pursuit for one's own purposes. In professions strictly so called a preliminary examination as to qualifications is usually demanded by law or usage, and a license or other official authority founded thereon required. In law the significance of the word has been contested under statutes imposing taxes on persons pursuing any "occupation, trade, or profession," and under statutes authorizing arrest in civil actions for misconduct in a "professional employment"; and it has been, in the former use, held clearly to include the vocation of an attorney, and upon the same principle would doubtless include physicians, unless the mention of trade, etc., in the same clause of the statute be ground for interpreting the statute as relating only to business vocations. Professional employment, in statutes allowing arrest, is regarded as not including a private agency like that of a factor or a real-estate broker, which can be taken up and laid down at pleasure.

Being mechanical, you ought not walk
Upon a labouring day without the sign
Of your *profession*. Speak, what trade art thou?

3. A public teacher in a university, especially one to whom this title has been formally granted. The title, now the highest that a teacher can receive, appears to have originated in the Italian universities. In Oxford and Cambridge, the professors, and the instruction which they convey by lectures, are only auxiliary instead of principal agents, the routine work of instruction being carried on by the tutors connected with the several colleges. In the universities of Scotland and Germany, on the other hand, the professors are at once the governing body and principal functionaries for the purposes of education. In American universities there is generally a professor at the head of each department of instruction, having often other professors and assistant professors under him. The title is often given, also, to teachers of special branches in secondary schools, and locally to principals of common schools (a use derived from the French).

Beneath the machine is suspended a pendulum always hanging vertically, and serving to actuate a pencil the point of which rests on the paper and leaves a trace upon it. The joints of a tapeworm, for example, are proglottides. This is what makes tapeworms such formidable parasites and so difficult to eradicate. For they are continually budded off from the scolex or "head" (really the whole worm), to the number sometimes of hundreds, like successive links of a chain; each such link or "joint" contains all the sexual elements, and is thus capable itself of starting a new series of the parasites in the eggs it produces. See cut under *Cestoidea*.

Each segment [of a tapeworm] is eventually found to contain a set of male and female organs. . . . At the extreme end of the body the segments become detached, and may for some time retain an independent vitality. II. *n.* 1. A body projected, or impelled forward by force, particularly through the air. Thus, a stone thrown from the hand or a sling, an arrow shot from a bow, and a ball discharged from a cannon are projectiles. The path of a projectile, or its trajectory (neglecting the effect of air-resistance), is a parabola.

The motion of a *projectile*—that is to say, of a body thrown in any direction and falling under the influence of gravity—was investigated by Galileo.
W. K. Clifford, Lectures, II. 13.

2. Specifically, a missile intended to be projected from a cannon by the explosive force of gunpowder or some similar agent. Projectiles used in smooth-bore guns are usually spherical, though sometimes oblong, as is the case in the Manby, Parrott, and Lyle life-saving projectiles. Projectiles for rifled guns are oblong, the cylindroconoidal form being generally adopted. It is essential for the range and accuracy of such a projectile that it should pass through the air in the direction of its longer axis, and the only certain method of effecting this is to give it a rapid rotary motion about this axis. To this end the projectile must be so prepared that it will engage and follow grooves in the bore of the gun. This is done in several ways: (*a*) By the *flange system*, in which the projectile is provided with flanges, studs, or buttons made of a soft metal, as copper, zinc, or brass, which fit into the grooves of the bore. (*b*) By the *expansive method*, often called the *American system*, in which the projectile is fitted with an expanding device made of softer material, such as brass, copper, or papier-maché, which is wedged into the grooves by the explosive force of the charge. This system requires more and shallower grooves than the flange system. Both the preceding methods are applicable to muzzle-loaders. (*c*) By the *compressive system*, in which the projectile is surrounded by a soft metal band or jacket, the diameter of which is greater than that of the bore without the grooves, the projectile being forced into and through the rifled part of the bore by the explosive force of the charge. The bands in the bore cut grooves in the encircling bands, which center and give rotation to the projectile. The rifling is polygroove and shallow, sometimes narrowing toward the muzzle. This system is in use in breech-loading guns.—**Armor-piercing projectile**, a projectile adapted, by its material and by special methods of hardening its point, to pierce modern armor-plate. A great advance in power of penetration has been secured by placing upon the point of the shell a soft metal cap which protects it from being broken by the hardened surface of the plate.—**Amplitude of the range of a projectile.**—See *amplitude*.—**Deviation of a projectile.**—See *deviation*.—**Horizontal range of a projectile.** See *horizontal*.—**Subcaliber projectile**, a projectile made of less diameter than that of the bore of the piece from which it is fired, but having a cup or disk large enough to fill the bore, allowing the ordinary windage; or it may have a cup or disk capable of being forced out to fill the bore when the gun is discharged. A high initial velocity is obtainable in subcaliber projectiles, for while their weight and hence inertia are much less than those of the full-sized shot, the area acted upon by the expanding gases is the same.—**Theory of projectiles**, that branch of mechanics which treats of the motion of bodies thrown or driven by an impelling force from the surface of the earth, and affected by gravity and the resistance of the air, as the motion of a cannon- or rifle-ball, or of a jet of water, etc.

projecting (prō-jek'ting), *p. a.* Inventive; enterprising. [Rare.]

projectingly (prō-jek'ting-li), *adv.* In the manner of something that juts out or projects.

A . . . hat . . . *projectingly* and out of all proportion cocked before. *Annals of Phil. and Penn.*, I. 381.

projection (prō-jek'shon), *n.* [< F. *projection* = Sp. *proyeccion* = Pg. *projecção* = It. *projezione*, < L. *projectio(n-)*, a throwing forward, a stretching out, < *projicere, proicere*, pp. *projectus*, throw forth: see *project*.] 1. The act of projecting, throwing, or shooting forward: as, the *projection* of a shadow upon a bright surface; hence, the act or process of throwing, as it were, something that is subjective into the objective world; the act of giving objective or seeming reality to what is subjective: as, the *projection* of a sensation of color into space as the quality of an object (a colored thing).—2. That image or figure which results from the act of projecting an idea or a sensation.

Doth, like a miser, spoil his coat with scanting
A little cloth. *Shak.*, Hen. V., ii. 4. 46.

5. (*a*) In *geom.*, the act or result of constructing rays or right lines through every point of a figure, according to certain rules. These rays are called *projecting rays*. In *central projection*, often called *projection* simply, the projecting rays all pass through one point called the *center of projection*. In this way a point is projected into a ray, a straight line into a plane. In *axial projection*, a plane, called a *projecting plane*, is passed through every point of the figure, all these planes containing one line called the *axis of projection*. (*b*) The act or result of constructing rays through every point of a figure, all passing through one point, and cutting these rays by a plane or other surface, so as to form a section on that surface which corresponds point for point with the original figure. (*c*) In *chartography*, the act or result of constructing a figure upon a plane or other surface, which corresponds point by point with a sphere, spheroid, or other figure; a map-projection (which see, below).—6. The mental operation in consequence of which objects of the imagination or retinal impressions appear to be seen external to us.

What we call the field of view is naught else than the external *projection* into space of retinal states.
Le Conte, Sight, p. 71.

7. In *alchemy*, the act of throwing anything into a crucible or other vessel, especially the throwing of a portion of philosopher's stone upon a metal in fusion with the result of transmuting it; hence, the act or result of transmutation of metals; humorously, the crisis of any process, especially of a culinary process.

Center of projection. See def. 5 (*a*).—**Central projection.** See *central* and def. 5 (*a*).—**Cylindrical projection.** See *map-projection*.—**Gauche projection.** See *gauche*.—**Geometric projection**, a parallel perspective projection equally inclined to the three principal axes of the body to be represented, as a machine.—**Homolographic, horizontal, imaginary, isometric, loxodromic projection.** See the adjectives.—**Globular projection.** See *map-projection*.—**Map-projection**, a system of continuous correspondence between the points of a spherical or spheroidal surface and those of a plane, this correspondence determining what points on a map represent given points on the earth, and conversely. Of the systems in use, only a small number are perspective representations (or rather perversions of such representations), so that the word *projection* must here be understood in a peculiar technical sense, not implying any simple geometrical relation between the sphere and the plane. The theory of projections is in itself one of the most scientific branches of applied mathematics; it may, indeed, be said to be simply the theory of functions viewed under the strong perspective of a practical standpoint. But only certain parts of the subject, such as the theory of orthomorphic projections, have as yet taken scientific shape. No satisfactory classification of map-projections is known; but orthomorphic, equivalent, zenithal (including the perspective), meridional, and conical projections are some of the main kinds. The following are the more important: *Airy's map-projection.* See *map-projection by balance of errors.*—*Albers's map-projection*, an equivalent map-projection in which the entire sphere appears as the space bounded by two lines and by two arcs of circles having their center at the intersections of these lines, these two arcs representing the infinitesimal parallels about the poles. The other parallels are concentric arcs having the same boundaries, and the meridians are straight lines radiating from the center. This map-projection was invented by H. C. Albers in 1805, and has been used for the map of Europe by Reichard.—*Apianus's map-projection*, a discontinuous map-projection in which the equator is represented by a limited straight line, and one of the meridians by a circle whose center bisects that line, while its circumference bisects each half formed by the first bisection; then, the semi-meridians toward the center are represented by arcs of circles cutting the equator orthogonally at equidistances, and bisecting the first circle at the points most distant from the equator; but the semi-meridians more distant from the center are represented by semicircles of the same radius as the full circle, and cutting the equator orthogonally at the same distances as the inner meridians; and the parallels are represented by equidistant straight lines parallel to the equator. This map-projection was much used in the sixteenth century, having been introduced by Peter Bennewitz or Apianus in 1524.—*Arago's map-projection*, a map-projection in which one of the meridians is a circle, and the parallels are parallel straight lines dividing the circumference of this circle into equal arcs, while the other meridians are ellipses dividing the parallels into equal parts. This projection was invented by the French astronomer Arago in 1834.—*Arrowsmith's map-projection.* See *globular map-projection* (*b*).—*Babinet's map-projection.* See *homolographic map-projection.*—*Bennewitz's map-projection.* Same as *Apianus's map-projection.*—*Bonne's map-projection*, an equivalent map-projection in which all the parallels are represented by concentric and equidistant arcs of circles, and the central meridian by a straight line, the central parallel being cut orthogonally by all meridians. The entire spheroid appears in a kidney shape. This map-projection was invented by Ptolemy, and described in his geography, although his rules for drawing it did not contemplate a degree of precision which the geographical knowledge of his time would not warrant. It was extensively used during the sixteenth century. It bears the name of the French geodesist Bonne, who improved the theory of it. It has been employed in several of the government maps of European countries. As ordinarily used, the poles are taken as these points, when the meridians appear as equidistant parallel lines, and the parallels as parallel lines cutting them at distances from the equator proportional to log tan ½ latitude. This has the advantage that the points of the compass preserve the same direc-

These were invented by Patrick Murdoch in 1758.—*Orthographic map-projection,* a perspective map-projection from an infinitely distant center.—*Orthomorphic map-projection,* a map-projection which preserves all angles—that is, the shapes of all infinitesimal portions of the sphere. When one such map-projection has been obtained, say the polar stereographic, which is the simplest, all others may be derived from this by a transformation of the plane. Let r and θ be the polar coordinates of any point on the polar stereographic projection, let i denote the imaginary whose square is -1, and let F denote any function having a differential coefficient. If, then, $F(r\cos\theta + r\sin\theta.i)$ be put into the form $x + yi$, x and y will be the rectangular coordinates of the corresponding point on another orthomorphic projection. In law, a promise is not binding in such sense as to be directly enforceable through the courts, unless made upon a consideration good or valuable; in which case the promise and the consideration together form a contract or agreement (if under seal, termed a *covenant*) which binds the promisor, and it may be his legal representatives, and gives the promisee, and in some cases a third person for whose benefit the promise was made, the right to enforce it by suit, or to recover damages for its breach.

Also called *The Promised Land*.

An *offer* is not binding till it is accepted; a *promise* is binding as soon as it is known by the party it is made to.—**Special promise,** an actual promise as distinguished from an implied promise.—**The Promise,** according to the account given in the Bible, the assurance given by God to Abraham that his descendants should become the chosen people, and that in him all the families of the earth should be blessed.

Scott, Ivanhoe, xxxii.

To give a lick and a promise of better. See *lick*.

=**Syn. 1.** *Assurance, Promise, Engagement, Pledge, Covenant.* These words are arranged in the order of strength; it would be dishonorable to fail to keep what even the weakest of them expresses. The formality and solemnity of each are proportioned to its strength. A *covenant* is a mutual obligation; the others are not. Each of them may be either spoken or written, but the written is generally more formal, and may have greater legal obligation.

pronghorn (prông'hôrn), *a.* and *n.* **I.** *a.* Having horns with a prong or snag, as the prongbuck: as, the *pronghorn* antelope.

II. *n.* The prongbuck or cabrit. This remarkable animal is an isolated American type, like the saiga of the Old World; it has no near relatives living, and is supposed to be in the line of descent from some stock more or less like the fossil *Sivatherium* of India. It is not an antelope in any proper sense, though universally so called in the regions it inhabits — the first literary use of the name dating about 1812. The pronghorn was first scientifically described from material furnished by Lewis and Clarke to George Ord, who called it *Antilope americana* in 1815, but very soon instituted the genus *Antilocapra* (which see, and *Antilocapridæ*, for technical characters). The male stands about 3 feet high at the croup and withers; the limbs are very slender; the general form is that of a deer, but rather stouter (contrary to a general impression); the eyes are extremely large and full, and placed directly under the base of the horns; these in the male are from 6 or 8 inches to a foot in length, curved variously, but always with the characteristic prong or snag — in the female mere hairy cones tipped with a horny thimble an inch long. The horns are shed annually, late in the fall or early in winter. The pelage is close, without any flowing tufts, but coarse and brittle, and nearly worthless; the hide makes a valuable buckskin when dressed. The venison is excellent, resembling mutton rather than deer-meat. There is an extensive set of cutaneous sebaceous glands, eleven in number, which during the rut exhale a strong hircine odor. The prongdoe regularly drops twins, usually late in spring or early in summer, and the kids are not spotted (as the young of *Cervidæ* usually are), but resemble their parents. The bucks and does are alike of a tawny or yellowish-brown color, with a large white disk on the buttocks, a white crescent and triangle on the fore part of the neck, and the under parts and inner sides of the limbs white; the forehead, muzzle, a spot on the neck over the gland, and the horns and hoofs are mostly black or blackish. During most of the year the animals go in bands, sometimes numbering thousands, but oftener of much less extent. They range over all the region of the great plains, from British America far into Mexico, excepting where they have of late years been driven off by the settlement of the country. Unlike the bison, the pronghorn does not appear to have ever ranged east of the Mississippi. It is noted for its fleetness, and for a singular mixture of timidity and curiosity, which renders it susceptible of being "flagged," or decoyed within rifle-range by the exhibition of any unusual object, as a handkerchief tied to a pole. The gait is buoyant and easy, and when bounding at full speed the animal is probably the fleetest of any American game. But it lacks bottom, and its astonishing bursts of speed cannot be long sustained. Almost any pack of hounds can overtake it, if the game has not too much advantage at the start. The pronghorn is subject to an epidemic disease of unknown character, which in some years has destroyed many thousands. This fact, together with the incessant persecution it suffers, has very appreciably diminished its numbers as well as contracted its range of late years, though it appears to be still very far from the point of extermination.

They are divided into various classes: *personal* (doubtless originally demonstrative), as *I, thou, he*, etc.; *possessive*, which are the adjective forms of the personal, as *my, thy, his*, etc., *demonstrative*, as *this, that*, etc.; *interrogative*, as *who, what*, etc.; *relative* (which are always either demonstratives or interrogatives with changed office, implying an antecedent to which they refer or relate), as *that, which, who*, etc.; and *indefinite*, which are of various meaning, and shade off into ordinary nouns, as *each, either, some, any, such*, etc. Abbreviated *pr., pron.*

Pronunciation of Greek and Latin. (*a*) *Continental pronunciation* or *system of pronunciation*, a system of pronunciation of Latin or Greek conforming or approximating to that in use on the continent of Europe, especially in the vowel-sounds. As each of the principal nations in western Europe pronounces Latin, and the most of them Greek also, in the main after the analogy of its own language, it is only in their chief points of agreement that a usage which can justify this epithet *continental* exists. The system of pronunciation known as *continental* retains, for the most part, the English sounds of the consonants, and pronounces the vowels as in German or Italian. There is a stricter form of continental pronunciation of Latin, approaching the Roman, and a modified form, approaching the English. The continental system of pronouncing Greek is often called *Erasmian*, as closely resembling the modified or modern Erasmian pronunciation used in Germany. (*b*) *Eclectic pronunciation (of Greek)*, a system of pronunciation of ancient Greek which seeks to approximate to the actual ancient pronunciation. It agrees on the whole with the stricter continental system, and pronounces the diphthongs so that each element can be heard separately. (*c*) *English pronunciation (of Greek)*, a system of pronouncing Greek with the English sounds of the corresponding Latin letters. This system is now little used in the United States. (*d*) *English pronunciation (of Latin)*, a system of pronouncing Latin which follows, with some exceptions, the general analogy of the modern pronunciation of English. The Latin rule of accentuation determines the place of the accent; but the vowels are given their long or short English sounds without regard to their Latin quantity. The English long sounds are used at the end of a word (but final *a* is usually obscure, as in *coma*), before another vowel, and at the end of an accented penult or of any unaccented syllable (except penultimate *i*). The English short sounds are used in a syllable ending with a consonant (except final *cs*, *os*), before two consonants (not a mute and liquid) and *x* (= *cs*), and (excepting *io*) in an accented antepenult before a single consonant, if not followed by two vowels the former of which is *e*, *i*, or *y*. *C*, *s*, and *t*, succeeding the accent, are equivalent to sh, and *x* is sounded like ksh, before two vowels the former of which is an unaccented *i* or *y*, unless *s*, *t*, or *x* precedes. Initial *x* is pronounced *z*. If the second of two initial consonants is not *h*, *l*, or *r*, the first (if not *s*) is silent. Initial *chth* and *phth* are pronounced th. There are no silent vowels. Different authorities vary these rules somewhat, or acknowledge various exceptions to them. The English system of pronunciation of Latin regulates the pronunciation in English of all proper names which have not altered their Latin spelling, and of all Latin words and phrases which have become Anglicized. (*e*) *Erasmian pronunciation (of Greek)*, a system the earliest champion of which was Erasmus in his treatise "De Recta Latini Græcique Sermonis Pronunciatione" (Basel, 1528). The pronunciation universally in use at that time was the modern Greek as used in the middle ages and supported by Byzantine scholars at the time of the revival of letters. Investigation led to a general conviction among scholars in the west of Europe that the Erasmian theory of the ancient pronunciation was correct; and by the end of the sixteenth century — after considerable controversy, embittered by the fact that the traditional or modern pronunciation was favored by supporters of the papacy, and the Erasmian system by the Reformers — the Erasmian system had come into general use, and the Byzantine method of pronouncing Greek as a living language — also called the *Reuchlinian*, from Johann Reuchlin, the first great representative of Greek scholarship in Germany — became obsolete in the western schools. In its original form the Erasmian pronunciation was distinguished from the Reuchlinian by giving most of the vowels the sounds which they have in Latin as pronounced by most of the western nations, the Italians, Germans, etc., and by pronouncing the diphthongs so that each vowel in them should preserve its own sound. As, however, this pronunciation closely approached that of the modern western languages in the sixteenth century, it became practically the usage that every nation should pronounce Greek after the analogy of its own language, and, as this has gradually changed in each country, the pronunciation of Greek has varied with it. In England, in the time of Henry VIII., the pronunciation of vowels was nearly the same as in continental languages. This is evident from the fact that the relation of the Greek vowels, as pronounced by the Erasmian system, to those in the Latin alphabet, as used in the vernacular, is treated by writers of that time as identical in England and on the continent. In England, accordingly, the Erasmian system of pronunciation was insensibly transformed into what is now called the *English pronunciation* of Greek. The system known as the *continental* is a partial revision of the Erasmian: that designated as the *eclectic* restores the Erasmian with some alterations. (*f*) *Modern Greek pronunciation*, the pronunciation of Greek, ancient and modern, actually in use in Greece at the present day. The change from the ancient to the present pronunciation was very gradual. The first signs of its prevalence are found in the Bœotian dialect and among Hellenists. Confusion of *ει* with *ι* became general about 200–100 B. C., but good speakers still made some difference between these sounds till after 200 A. D. The vowel *η* began to be frequently confounded with *ι* about 250–150 B. C., but persons of culture retained the sound of a Latin *ē* (English *ā*) for it till 500 A. D. or later. The diphthong *αι* became identical in sound with *ε* about 150–200 A. D., and somewhat later *οι* was pronounced like *υ* (*ü*). The vowel *υ* was distinguished from *ι* till late Byzantine times. After about 150–200 A. D. *αυ*, *ευ* came to be sounded as av, ev, and later as af, ef before sounds. During the Roman imperial period distinctions of quantity fell more and more into disuse, and merely accentual poetry began as early as the fourth century. In Egypt and other countries outside of Greece these changes of pronunciation began very early, and even the older manuscripts are accordingly full of their effects (*iotacisms*). This system of pronunciation prevailed throughout the middle ages not only in the East, but in the West till the time of the Reformation. Also called *iotacism*, *itacism*, *Reuchlinian pronunciation*. (*g*) *Reuchlinian pronunciation (of Greek)*. Same as (*f*). See (*e*). (*h*) *Roman pronunciation (of Latin)*, a system of pronunciation of Latin which seeks to approximate to the actual ancient pronunciation. It differs from the stricter continental system chiefly in the sounds given to *æ*, *œ*, *e*, and *v*, and in having only one sound for each vowel. In the ancient pronunciation *e* and *o* varied in sound, and there are indications that the short vowels in general differed somewhat in quality from the long vowels. The following tables exhibit the leading systems described above.

In all these systems *κ*, *λ*, *μ*, *ν*, *π*, *ρ*, *σ*, *τ*, *φ*, and *ψ* respectively have the same sounds as *k*, *l*, *m*, *n*, *p*, *r*, *s*, *t*, *f*, and *ps*. The sounds given in parentheses represent the stricter continental pronunciation. *γ*[2] is *γ* before *γ*, *κ*, *ξ*, *χ* (*γ*[1] being *γ* elsewhere); gh represents the corresponding sonant to ċh (nearly as German *g* in *Wagen* as pronounced by most Germans). In the Modern Greek system *χ* is ch as in German *ich*, and *γ* is y before ä and ĕ sounds (*ε*, *ι*, etc.); *γκ* is ngg, *μπ* is mb, and *ντ* is nd. The strict continental system and the Modern Greek pronounce by the written accent, while the English and the modified continental accent Greek by the rule for accent in Latin. The two last-named systems generally make *α* and *ι* long in open syllables and short in closed syllables (the English pronunciation treating them as *ā* and *ī* in Latin), but *υ* is always long.

In all these systems *b*, *d*, *f*, *h*, *k*, *l*, *m*, *n*, *p*, *ph* (= *f*), *q* (*qu* = *kw*), *r*, *t*, *th* (in *thin*), have their ordinary English sounds. *C*[2] and *g*[2] represent *c* and *g* before *e*, *æ*, *œ*, *i*, and *y*; *c*[1] and *g*[1] represent *c* and *g* before other letters than these. The short vowel-sounds are used in the English and in the modified continental system in closed syllables, and the long vowel-sounds in open syllables, regardless of the ancient quantity. The Roman system gives the same quality of sound to a short vowel as to a long, but makes it more rapid in pronunciation. In continental pronunciation *s* is by some pronounced *z* between two vowels, and in the modified system final *ēs* is pronounced āz, and final *ōs* ōs. For the pronunciation of *c*, *s*, and *t* as sh, and of *x* as ksh or z, see (*d*). Pronounce *u* as in German, or as French *u*.

Prony's dynamometer. A dynamometer, named after its inventor, much used for obtaining data for computing the power delivered by turbines and other water-wheels, or from the fly-wheel of an engine, or transmitted by shafting. The principle of this apparatus is the same in all of its forms. In the accompanying illustration, which represents a form of the apparatus used in laboratories, *e* is a shaft provided with a winch *c*, and supported in bearings *d* in a frame *h*; *j* is a lever having a scale-pan suspended from the point *m* near the extremity of the longer arm as shown at *b*, on which, when in use, a weight or weights *i* are placed; *a* is a counterpoise; *f* is a chain connected at its ends to tightening-bolts *k*, *k′*; *l* indicates wooden brake-shoes, which, by tightening the chain *f*, can be made to press strongly against the projecting end of the shaft *e*; *g*, *g′* are stop-tests, which limit the motion of the lever, used only for convenience in applying the brake, and not essential to its action. In the determination of the power transmitted through the shaft *e*, moving in the direction shown by the arrow, the counterpoise is first adjusted to counterbalance the long arm of the lever and the empty scale-pan. The chain *f* is then tightened and the scale-pan loaded, so that at a given velocity the lever is by the friction of the brake held away from the rest *g′*, but not in contact with *g*. Under conditions so established, if L = the perpendicular distance in feet of the point *l* from the axis of *e*, S = the weight in pounds placed in the pan, *r* = the radius in feet or fractions of a foot of the shaft *e*, and M = the moment of torsion in pounds, then will LS/*r* = M, and 2π*r*M = the power transmitted in foot-pounds during each turn of the winch. Also called *Prony's brake*.

Prony's Dynamometer.

proœmiac (prō-ē′mi-ak), *a.* [< *proœmium* + *-ac*.] Relating to or constituting a proœmium or preface.

2. Evidence and argumentation putting the conclusion beyond reasonable doubt; demonstration, perfect or imperfect.

Trifles light as air
Are to the jealous confirmations strong
As *proofs* of holy writ. *Shak.*, Othello, iii. 3. 324.

They [miracles] are not private, but public *proofs*; not things to be done in a corner, for the sake of single persons, but before multitudes, and in the face of the sun.
Bp. Atterbury, Sermons, I. xii.

Cowper, Conversation, l. 722.

3†. A thing proved or tried; truth or knowledge gathered by experience; experience.

Have never wing'd from view o' the nest, nor know not
What air 's from home. *Shak.*, Cymbeline, iii. 3. 27.

4. The state of having been tested and approved; firmness, hardness, or impenetrability: specifically applied to arms or armor of defense, to note that they have been duly tested and are impenetrable.

From love's weak childish bow she lives unharm'd.
Shak., R. and J., i. 1. 216.

They harnessed him from head to foot with what was of *proof*, lest perhaps he should meet with assaults in the way. *Bunyan*, Pilgrim's Progress, p. 124.

5. In *law:* (*a*) The convincing effect of evidence; the manifestation of the truth of a proposition by presenting the reasons for assenting to it; such an array of evidence as should determine the judgment of the tribunal in regard to a matter of fact. In criminal cases, to be effectual as proof, the evidence must satisfy beyond a reasonable doubt. In civil cases it is enough that the evidence preponderates.

Evidence is the medium of *proof; proof* is the effect of evidence. *Judge Danforth*, 108 N. Y., 73.

(*b*) *pl.* In equity practice, the instruments of evidence in their documentary form, as depositions, deeds, etc., received in a cause. (*c*) The presentation of sufficient evidence: as, the burden of *proof* lies with the plaintiff. *Proof* is either written or parole. The former consists of records, deeds, or other writings; the latter of the testimony of witnesses personally appearing in court or before a proper officer, and, as a rule, sworn to the truth of what they depose. In this sense the word is used to designate either the task of going forward with the giving of evidence at the trial or the task of satisfying the minds of the jury. Owing to the different functions of the judge and the jury, the distinction is of great practical importance, because when the plaintiff has given evidence which would entitle him if unanswered to go to the jury, it is proper for him to tell counsel that the burden of proof is on defendant, meaning that if the defendant adduces no evidence the plaintiff will be entitled to have the case submitted to the jury; but it is error for him thereupon, whether defendant offers evidence or not, to tell the jury that the burden of proof is on defendant to contradict plaintiff's case, for, considered as a task of satisfying the jury, the burden of proof remains upon the plaintiff throughout. The burden of proof is never on the defendant in this sense, except in respect to an affirmative defense in avoidance as distinguished from a denial. (*d*) In Scots law, the taking of evidence by a judge upon an issue framed in pleading. Sometimes disputed facts may be sent to a jury, but, except in actions of damages, a proof is almost invariably the course adopted. . . . The evidence as the proof is taken down in shorthand, and counsel are heard at the close. *Henry Goudy.*

6. A test applied to manufactured articles or to natural substances prepared for use; hence, the state of that which has undergone this test, or is capable of undergoing it satisfactorily. Compare *armor of proof.*—7. In alcoholic liquors, the degree of strength which gives a specific gravity of 0.920. See II., 2. Liquors lighter than this are said to be *above proof*, and heavier liquors are *below proof*. See *overproof* and *underproof*.

The expressions "20 per cent over proof," "20 per cent under proof," mean that the liquor contains 20 volumes of water for every 100 volumes over or under this fixed quantity, and that, in order to reduce the spirit to *proof*, 20 per cent of water by volume must be subtracted or added as the case may be. *Spons' Encyc. Manuf.*, I. 215.

8. In *printing*, a trial impression from composed type, taken for correction. Generally a number of successive proofs are read before the matter is ready for the press, corrections being made first in the printing-office until what is technically called a *clean proof* can be submitted to the author. The final proof is called a *press-proof* or a *foundry-proof*, the first being used of letterpress work, and the latter of plate-work.

Lap. What says my printer now?
Gal. Here 's your last *proof*, sir. [Giving proof-sheet.] You shall have perfect books now in a twinkling.
Fletcher (and another?), Nice Valour, iv. 1 (circa 1625).

9. In *engraving* and *etching*, an impression taken from an engraved plate to show its state during the progress of executing it; also, an early and superior impression, or one of a limited number, taken before the title or inscription is engraved on the plate, and known as *proof before letter*. There may be first, second, and third proofs, marking successive states of the work. See also *artist's proof, India proof, proof with open letters,* and *proof with remarque*, below.

10. In *numis.*, any early impression struck at the mint from a coin-die used for producing the current coins of the realm. Proofs are often distinguished from the coins struck off for actual currency by having their edges left plain instead of being milled or inscribed. They are also often struck in a metal of greater or less value than that which is proper to the current coin: thus, there are gold, silver, and bronze *proofs* of the English copper farthing issued by George III. in 1799. Compare *pattern*, 8.

These remarks are sometimes used to denote the different states of the plate up to the point of completion.—**Pure proof.** See *pure*1.—**To the proof** to the quick; so as to touch a vital part.

But now I'll speak, and *to the proof*, I hope.

Gun-barrels which meet the test are then stamped with authorized proof-marks.

It is used in experiments on the distribution of electricity on conductors. When it is laid against the surface whose electric density it is intended to measure, it forms, as it were, a part of the surface and takes the charge due to the area which it covers, which charge may be carried to an electrometer and measured.

proof-reader (pröf'rē"dėr), *n.* A person who reads printers' proofs for correction; one whose occupation is to discover errors in proofs and note on them the necessary changes. A *critical* or *editorial proof-reader* is one who not only corrects the compositors' errors, but notes or points out the lapses of the original text, or makes or indicates changes for its improvement. Proof-readers were originally called *correctors of the press*, and that phrase still remains in literary or formal use, especially for those who read proofs for criticism as well as for correction.

proof-reading (pröf'rē"ding), *n.* The correction of errors in printers' proofs. See *proof-reader.* In marking a proof, the places in the text where changes are to be made are indicated in the following modes. A caret (^) is inserted in the bottom of a line at a point where something is to be put in or a new paragraph is to be made; a line is drawn through anything to be taken out or changed for something else, and under anything to be changed to different type; the mark ⌐ is made to the left of a word to be shifted in that direction, and ⌋ to the right; and letters or parts of a word improperly separated are connected by a curve or curves (⌣ or ⊃). In the last two cases the same marking is repeated in the margin. The other indicative marks or signs made in the margin (besides a few strictly technical ones, which admit of much variation) are the following: ꝺ or ℋ (*dele-mark*), representing *d* (ꝺ) for *dele*, take out; ϥ (*turn-mark*), for turning an inverted letter; # (*space-mark*), for inserting a space, or more space; ⏊, for putting down space; □, for inserting an em-quadrat, or increasing the space to that amount; ¶ (*paragraph-mark*), for making a new paragraph; ×, for a broken or imperfect letter; *stet* (let it stand), for something that is to remain after being crossed out, a row of dots being made under the erasure; *tr.* for *transpose; w. f.* for *wrong font* (meaning a letter or letters of different size or face from the others); *ital.* for *italic*, and *rom.* for *roman; cap.* or *caps.* for *capital* or *capitals; s. c.* for *small capitals; l. c.* for *lower-case.* In the last five cases, where only a single letter is involved, proof-readers usually write the letter itself in the margin, in the form desired, or with the proper underscoring. In underscoring, italics are indicated by a single line, small capitals by two lines, and capitals by three lines. A single letter written as a capital does not usually need to be underscored. Where two paragraphs in the text are to be joined or "run in," a line curving at the ends is drawn between them, and "No ¶" written in the margin. A marginal correction should always be written as nearly as possible opposite the place affected in the text; and where the connection cannot thus be made clear, a line should be drawn between the place and the correction.

proof-sheet (pröf'shēt), *n.* A printers' proof.

Mr. Arthur Pendennis having written his article, . . . reviewed it approvingly as it lay before him in its wet *proof-sheet* at the office of the paper.

It frequently remains distinct from the other otic bones; in man it assists the opisthotic in the formation of the mastoid as well as the petrous part of the temporal bone. See cuts under *Crocodilia*, *Gallinæ*, and *periotic.*

The *pro-otic* is, in fact, one of the most constant bones of the skull in the lower Vertebrata, though it is commonly mistaken on the one hand for the alisphenoid, and on the other for the entire petro-mastoid.

A principle common to all this class of propellers is that a vessel is moved forward by the reaction on the propeller of the water thrown rearward, the propelling machinery being at some part or parts rigidly attached to the ship. The Puritans maintained frequent religious exercises, in which texts of Scripture were interpreted or discussed, one speaking to the subject after another, in an orderly method. Dan. *profet*, < LL. *propheta, prophetes* = Goth. *praufētēs, praufētus*, < Gr. *προφήτης*, Doric *προφάτης*, one who speaks for a god, an interpreter (as Tiresias was of Zeus, Orpheus of Bacchus, Apollo of Zeus, the Pythia of Apollo), expounder (as those who interpreted the words of the inspired seers), proclaimer, harbinger (as the bowl is of mirth, or the cicada of summer), in the Septuagint an interpreter, spokesman, usually an inspired prophet, also a revealer of the future, in N. T. and eccl. an interpreter of Scripture, a preacher, < *προφάναι*, say before or beforehand. < *πρό*, before, in public, + *φάναι*, speak, say: see *fable, fame*[1], *fate*.] 1. One who speaks by a divine inspiration as the interpreter through whom a divinity declares himself. In the times of the Old Testament there was an order of prophets, for the duties of whose office men were trained in colleges called *schools of the prophets*. The members of these schools acted as public religious teachers, and the prophets in the stricter sense (inspired teachers) generally belonged to this order. In the New Testament, Christian prophets were recognized in the church as possessing a charism distinct from that of mere teachers, and as uttering special revelations and predictions. They are often mentioned with apostles, and next after them in order.

Ihesus that sprong of iesse roote,
As us hath preclid thi *prophete*.
Hymns to Virgin, etc. (E. E. T. S.), p. 12.

The word *prophet* (*προφήτης*) was derived in the first instance from the interpreters of the will of the gods (see Pindar, N., i. 91); later and especially it was applied to those who expounded the unintelligible oracles of the Pythoness of Delphi, or the rustling of the leaves of Dodona. In a metaphorical sense it was used of poets, as of interpreters of the gods or Muses. It was then adopted by the Septuagint as the best equivalent of the *nabi* or *prophet* of the Old Testament. . . . In all these cases (Acts ii. 17, 18; xiii 1; xv. 32; Rev. i. 3; xi. 3, 6, 10, 18; xvi. 6; xviii. 20, 24; xix. 10; xxii. 6, 7, 9, 10, 18), in the New Testament as in the Old, and it may be added in the Koran, the prominent idea is not that of prediction, but of delivering inspired messages of warning, exhortation, and instruction; building up, exhorting, and comforting; convincing, judging, and making manifest the secrets of the heart (1 Cor. xiv. 3, 24, 25). The ancient classical and Hebrew sense prevails everywhere. Epimenides and Mahomet on the one hand, Elijah and Paul on the other, are called *prophets*, not because they foretold the future, but because they enlightened the present.
A. P. Stanley, Com. on Corinthians, p. 243.

2. One who foretells future events; a predicter; a foreteller; especially, a person inspired to announce future events.

Polybius was of the best sort of *prophets*, who predict from natural causes those events which must naturally proceed from them. *Dryden*, Character of Polybius.

A *prophet* certain of my prophecy,
That never shadow of mistrust can cross
Between us. *Tennyson*, Geraint.

3. An orthopterous insect of the family *Mantidæ*. [Local, U. S.]—**French prophets**, a name sometimes given in England to the Camisards.—**Major prophets**, Isaiah, Jeremiah, Ezekiel, and Daniel; also, the books of their prophecies in the Old Testament.—**Minor prophets**, the writers of the Old Testament from Hosea to Malachi inclusive; also, their books. The distinction between *major* and *minor* relates to the size of the books.—**School of the prophets**, among the ancient Jews, a school or college in which young men were educated and qualified to be public teachers. One elderly or leading prophet presided over them, called their *father* or *master*; hence the students were called *sons of the prophets*. Their chief subject of study was the law and its interpretation, but music and sacred poetry were subsidiary branches of instruction.—**The Prophets**, those books of the Old Testament which are largely composed of prophecies, or which were written or compiled by members of the order of prophets. The ancient Jews sometimes divided the Old Testament into the Law (Pentateuch) and the Prophets, and sometimes (as still in Hebrew Bibles) into Law, Prophets, and Hagiographa. In Hebrew Bibles the *Former Prophets* are Joshua, Judges, I. and II. Samuel, and I. and II. Kings; the *Latter Prophets* are the books from Isaiah to Malachi inclusive, with the exception of Lamentations and Daniel, which are placed in the Hagiographa.

On these two commandments hang all the law and *the prophets*. Mat. xxii. 40.

=Syn. 1. *Prophet, Seer, Soothsayer*. A *prophet* is properly one who discloses or speaks forth to others the will of God; a *seer* is one who has himself learned God's will by a vision. Both titles were applied in the Old Testament to the same class of men, but at different times. The extra-Biblical uses of the words correspond to the Biblical. The word *prophet* is sometimes used in the Bible of a candidate for the prophetic office, or of an inspired preacher or interpreter. *Soothsayer*, as used in the Bible, implies imposture, and in other literature its standing is little better.

Beforetime, in Israel, when a man went to enquire of God, thus he spake, Come, and let us go to the *seer*: for he that is now called a *Prophet* was beforetime called a *Seer*. 1 Sam. ix. 9.

They had with them inspired men, *Prophets*, and it were not sober to say they did ought of moment without divine intimation. *Milton*, Church-Government, i. 2.

=Syn. *Atonement*, *Reconciliation*, *Propitiation*, *Expiation*, *Satisfaction*. By derivation and by Biblical usage *atonement* and *reconciliation* are essentially the same: two that were alienated are made at one, or put back into friendship. *Atonement*, however, is not now applied to the relation of man to man, except in its extra-Biblical extension, by which it means also the making of full and satisfactory amends (*satisfaction*) or the enduring of proper penalties (*expiation*) for a great wrong: as, there could be no *atonement* for such an outrage. As applied to the relations of God and man, *atonement* has been lifted into much greater dignity than any other word in the list; it is now the august, chosen, and only endeared word for the effect of the life and especially of the death of Christ in establishing right relations between God and man; *reconcile* and *reconciliation* are the principal words for this in the New Testament, *atonement* being used only once, and *atone* not at all. *Propitiation* is the only one of these words having exclusive reference to the feelings or purposes of the person or being offended; it is a severe word, implying slowness to relent, and is, in regard to the attitude of God toward man, chiefly a theological term. *Expiation* regards the guilt of the offense; it is the suffering of the penalty proper for an act (as, to make *expiation* for one's crime upon the scaffold), or of an adequate substituted pain. The word is general, and only barely Biblical (Num. xxxv. 33, margin, and revised version), although the fact is by the mass of Christians believed to lie in some form in the sufferings of Christ. *Satisfaction* in this connection means adequate amends: as, *satisfaction* for an insult or for damage; the word has been taken by a school in theology to express the sufficiency of the sufferings of Christ to meet the demands of the retributive justice of God.

The *atonement* has for its object to restore that relation of man to God which sin had disturbed, and to reconcile the sinner to God.
Ullmann, Sinlessness of Jesus (trans.), IV. ii. § 2.

The doctrine of *Reconciliation* has not escaped the fate of other Christian truths; it has done and is doing its work in converting the world, and consoling many a crushed heart; but at the same time the terms in which it should be set forth have been disputed, and sometimes the doctrine itself denied.
W. Thomson, in Aids to Faith, Essay viii., Int.

We may have it as our privilege, I think, when our mind recoils from the tremendous difficulty of *propitiation* itself, to carry the whole matter up above the ranges of time, and look on him who stands there "in the midst of the throne, as it had been a Lamb slain from the foundation of the world."
H. Bushnell, Forgiveness and Law, i. 4.

In the great tragic poet Æschylus is a striking instance of *λυτηρ* in the sense of an *expiation* or *atonement* for murder. The chorus of mourning women, bewailing the untimely end of Agamemnon, exclaim, "What *atonement* is there for blood that has fallen on the ground? . . . All the rivers moving in one channel would flow in vain to purify murder." *J. P. Thompson*, Theology of Christ, v.

Satisfaction expresses the relation which the work of Christ sustains to the demands of God's law and justice.
A. A. Hodge, Outlines of Theology, xxii. 2.

=Syn. 1. Gracious, benign.—2. *Auspicious*, *Propitious*, promising. *Auspicious* cannot be safely used in any meaning beyond that of giving omen or indication of success; an *auspicious* event is one that seems an omen of prosperity for that which follows. *Auspicious* could be applied to a person only by a highly figurative use of the word.' The earlier tendency to use the word outside of the limits here indicated is not now sanctioned by good usage. *Propitious* applies primarily to persons, but may be freely extended by figure to things. *Propitious* goes beyond *auspicious* in representing a benign disposition and manner, leading one to expect a kind reception and help.

3. A representation in thought or language of an act of the mind in thinking a quality or general sign, termed a *predicate*, to be applicable to something indicated, and termed a *subject*. This connecting of predicate and subject may range from a mental necessity to a mere impulse to look at a certain possibility. These differences are called differences in the *mode*, or *modality*, of the proposition, according to which, as ordinarily stated, propositions are either *de inesse* (that is, the mode is not considered) or *modal*, and in this case *problematical*, *contingent*, or *apodictic*. The modality may properly be said to affect the copula, or form of junction of the predicate and subject. The predicate, logically speaking, embraces the whole representation of the quality of the fact. Thus, in the proposition "Elijah was caught up to heaven," the grammatical predicate is "was caught up to heaven"; but the logical predicate includes the whole picture which the sentence conveys—that of a man caught up to heaven. The predicate, however, is not a mere picture; it views the fact represented analytically, and distinguishes certain objects as identical with the subjects. There may be only one subject, or, if the predicate expresses a relation, there may be several. These subjects cannot be sufficiently indicated by any general description, but only by a real junction with experience, as by a finger-pointing. In ordinary language they are for the most part but imperfectly expressed. In whatever way they are represented, they can commonly (in the last analysis always) be set forth in classes only; from such a class the subject meant is to be taken in one or other of three ways: first, by a suitable selection, so as to render the proposition true; secondly, by taking any one, no matter which; thirdly, by taking no matter what one among a selected proportion of those which present themselves in experience. The first mode of selection gives a particular proposition, as "An object can be selected which is a man caught up to heaven"; the second mode gives a universal proposition, as "Take any object you please in this world, and it is not a man caught up to heaven"; the third mode gives a statistical proposition, as "Half the human beings in the world are women." If there are several subjects, the order of their selection is often important. Thus, it is one thing to say that having taken any man you please a woman can be found who was his mother, and quite another to say that a woman can be found such that, whatever man you select, that woman was that man's mother. Several of the distinctions between propositions found in the old treatises are based on distinctions between the different categories (or, in modern logical language, *universes*) from which the subjects are understood to be drawn. Such is the distinction between a *categorical proposition*, whose subject is denoted by a noun, and a *hypothetical proposition*, whose subject is a hypothetical state of things denoted by a sentence. Such is also the distinction between a *synthetical proposition*, whose subject is drawn from the world of real experience, and may suitably be denoted by a concrete noun, and an *analytic proposition*, whose subject is drawn from a world of ideas, and may suitably be denoted by an abstract noun. Propositions are further distinguished according to the forms of their predicates; but these distinctions, unlike those already noticed, merely concern the form under which the proposition happens to be thought or expressed, and do not concern its substance. The predicates of propositions are either simple, negative, or compound; and in the latter case they may conveniently be considered (by a slight fiction) as either disjunctive or conjunctive.

A *proposicion* is a perfeicte sentence spoken by the indicative mode, signifiyng either a true thing or a false without al ambiguite or doubtfulnesse.

Specifically—(*b*) The subject of a fugue, as distinguished from the *answer*.—**Absolute, adversative, affirmative, ampliative, analytical, apodictic, assertory, binary, categorical, causal, cognate proposition.** See the adjectives.—**Composite proposition**, a proposition consisting of several propositions all asserted at once.—**Compound proposition**, a proposition consisting of two or more propositions, associated copulatively, disjunctively, conditionally, or otherwise.—**Comprehensive proposition**, a proposition in which the subject is regarded as a whole of logical comprehension including the predicate as a part.—**Conditional, conflictive, contradictory, contrary proposition.** See the adjectives.—**Contrariety of propositions.** See *contrariety*.—**Converted proposition, converting proposition.** See *convert*.—**Copulative proposition**, a proposition consisting of parts united by a copulative conjunction; a composite proposition.—**Correlative proposition.** See *correlative*.—**Cumulative proposition**, a proposition regarded as a compound of singular propositions, united conjunctively or disjunctively. Thus, "every man is mortal" is cumulative, as implying the first, the second, the third, etc., man to be, each of them, mortal.—**Descriptive proposition.** See *descriptive*.—**Dialectic proposition.** (*a*) A probable interrogation; a problem suitable for discussion. (*b*) An assumption of what appears likely.—**Dilemmatic, discretive, disjunct, disjunctive, divided proposition.** See the adjectives.—**Dual proposition.** Same as *binary proposition*. Local proposition. See *local*.—**Major proposition**, a major premise.—**Minor proposition**, a minor premise.—**Modal, necessary, negative proposition.** See the adjectives.—**Numerically definite proposition**, a proposition which states how many objects, at least, there are of a given description.—**Obligistic proposition**, a proposition which has to be admitted in disputation owing to institution, petition, position, deposition, dubitation, or truth.—**Opposite propositions**, propositions having the same terms but not identical: as, Some woman is mother of some man; Some woman is mother of each man; Some woman is mother of every man; Every woman is mother of some man; All women are mothers of one man; Every woman is mother of every man.—**Particular, perfect, practical, principal, privative proposition.** See the adjectives.—**Possible proposition.** Same as *problematic proposition*.—**Predicative proposition.** Same as *categorical proposition*.—**Probable proposition**, a proposition stating with more or less determinacy how often within a certain genus of events a certain specific event would be found to occur, in a given range of experience.—**Problematic proposition**, a proposition asserting something to be possible in some sense.—**Proposition de inesse.** See def. 3.—**Proposition de necessario**, a proposition thought to be necessary. Such propositions were divided by the old logicians into (*a*) propositions *de necessario conditionali*, which stated something to be necessarily true, provided a certain condition held; (*b*) propositions *de necessario quando*, which stated something to be necessarily true at specified times; and (*c*) propositions *de necessario simpliciter*, or categorical apodictic propositions. The latter were further divided into propositions *de necessario simpliciter pro nunc*, or propositions stating something to be necessarily true now, and propositions *de necessario simpliciter pro semper*, stating something to be always necessarily true.—**Proposition de omni**, a universal proposition.—**Proposition in sensu composito**, a proposition in which the expression of the mode is attached to the subject or predicate. Such a proposition, as remarked by Scotus, is not, properly speaking, a modal but an ordinary proposition concerning possibility.—**Proposition in sensu diviso**, a proposition in which the expression of the mode is attached to the copula.—**Proposition per se**, a proposition which asserts something to be essentially true—that is, the universe is a universe of essences, not of existences. Four modes of such propositions are recognized by Aristotle: first, where the predicate is involved in the idea of the subject; second, where the subject is involved in the idea of the predicate; while the third and fourth modes are respectively modes of existing and of causing.—**Propositions of second adjacent, of third adjacent.** See *adjacent*.—**Pure proposition**, a proposition not modal.—**Pythagorean proposition.** See *Pythagorean*.—**Quantified proposition**, a proposition in which the manner of selecting the subject is fully expressed.—**Rational proposition**, a hypothetical proposition in which several categoricals are united by a causal conjunction.—**Reciprocating proposition**, one which asserts two terms to be coextensive: as, "Man" is identical with "rational animal."—**Relative proposition**, a proposition whose predicate is a relative term.—**Remotive proposition.** See *remotive*.—**Restrictive proposition**, a proposition with a restrictive clause: as, Christ, in his divine nature, is omnipresent.—**Simple proposition.** (*a*) Properly, a proposition whose predicate is simple: as, There is a man. (*b*) Usually, a categorical proposition, or one expressed by means of a noun and a verb, as contradistinguished from a *conditional proposition*.—**Singular proposition**, a proposition whose subjects are single individuals: as, Cain killed Abel.—**Spurious proposition**, a proposition one of the subjects of which is a character designated as one of those which belong to a given group. Thus, from the premises, Every European wants some character of Americans, and Every nobleman possesses some character other than those that are common to Americans, we can infer, first, that every European wants some character different from some character common to noblemen, and that every nobleman possesses a character different from some character wanting to every European. These are spurious propositions.—**Statistical proposition**, a proposition which states how many objects of one kind there are in connection with each one of another kind, in the average of a certain time of experience.—**Subaltern proposition**, a proposition asserting a part, and only a part, of what is asserted in another proposition.—**Subcontrary propositions**, propositions which have the same terms and may be true together but cannot be false together.—**Syllogistic proposition**, a proposition forming part of a syllogism.—**Synthetic proposition.** See *synthetic judgment*, under *synthetic*.—**Temporal proposition**, a proposition consisting of two categoricals united by a temporal adverb.—**Ternal or trinary proposition**, a proposition of third adjacent.—**Theoretical proposition**, a proposition concerning the fact, not concerning what ought to be done.—**True proposition.** See *true*.—**Universal proposition**, a proposition whose subject is any object whatever in the universe of discourse: as, Take any object you please, you will find it not a griffin. Every such proposition states the non-existence of something. If, in addition, it asserts the existence of something, it should be regarded as a composite proposition, partly universal and partly particular. But many logicians divide universal propositions into different species according as they do or do not assert the existence of their subjects. The result of this mode of treating the subject is a highly complicated doctrine.—**Unquantified proposition**, an indefinite proposition.=Syn. 2. *Overture*, etc. See *proposal*.—3 and 5. Position, thesis, statement, declaration, dictum, doctrine. *Proposition* differs from the words compared under *subject*, in that it is the technical word in rhetoric for the indication of the theme of a discourse.

The *proposition* is that part of a discourse by which its subject is defined. It includes, therefore, but is not restricted to, that which is termed *proposition* in the nomenclature of logic. It embraces all varieties of rhetorical form by which a *subject* is indicated to the audience. An interrogative may be in rhetorical dialect the *proposition*.

Where such stays pass through flues of steam-boilers, they are usually made tubular, thus permitting water to flow through them as a protection from overheating, while at the same time their exteriors become more or less effective heating-surfaces. See *parenchyma*. In most of the lower plants it is barely if at all developed, but in the higher plants it exists as a skeleton which brings all the parts into closer relation. The solid wood of trunks and the veins of leaves are familiar examples. As in parenchyma, the cells composing this tissue are very various in form, size, etc., and have been minutely classified, yet they may be reduced to a few comparatively simple types. These cells, which are normally of considerable length in proportion to the transverse diameter, are generally more or less sharply pointed, and are divided into typical wood-cells and woody fibers (including libriform cells and secondary wood-cells) and vasiform wood-cells or tracheids. The most important modification is that in which cells belonging to this system unite to form long rows in which the terminal partitions are nearly or quite obliterated, throwing the cavities into one, forming a duct. These ducts or vessels may be dotted, spirally marked, annular, reticulated, or trabecular. A modification in a different direction produces bast-cells, bast-fibers, or liber-fibers. proteid[1] (prō'tē-id), *n.* [< *prote(in)* + *-id*[1].] A substance formerly supposed to contain protein as an essential ingredient. The term is now applied to a considerable number of nitrogenous bodies which make up the substance of the soft tissues of the body and of the blood, and are also widely distributed in the vegetable kingdom. They are amorphous solids, having certain general features in common, but differing widely in solubility and in their decomposition products. The gluten of flour, egg, albumin, the fibrin of the blood, syntonin, and casein are examples of proteids. Gelatin and chondrin Huxley calls outlying members of the same group. Also called *albuminoid*.

Food-stuffs have been divided into heat-producers and tissue-formers—the amyloids and fats constituting the former division, the *proteids* the latter. But this is a very misleading classification, inasmuch as it implies on the one hand that the oxidation of the *proteids* does not develop heat, and on the other that the amyloids and fats, as they oxidize, subserve only the production of heat. *Proteids* are tissue-formers, inasmuch as no tissue can be produced without them; but they are also heat-producers, not only directly, but because, as we have seen, . . . they are competent to give rise to amyloids by chemical metamorphosis within the body.
Huxley and Youmans, Physiol. (1875), § 176.

The name, first applied to the Lutherans who protested at the Diet of Spires in 1529, came to be applied to Lutherans generally, and afterward was extended to Calvinists and other opponents of the papacy in countries where the papacy had formerly been in power. (See *protest of Spires*, under *protest*.) The Protestants gained a strong foothold in some countries, as France, in which they are now numerically weak. They are in the majority in Great Britain and many of its possessions, in Germany, the Netherlands, Switzerland, the Scandinavian countries, and the United States.

The genus is the same as *Amœba*, a common species of which is named *Amœba proteus*. This generic name is untenable, because antedated in the binomial system by the amphibian genus *Proteus* of Laurenti, for, although the name *proteus* was first applied to these animalcules, it was given at a time when genera, in the modern sense of the term, had not been established in zoology. See cut under *Amœba*.

the spore in the higher cryptogams, and which bears the sexual organs (antheridia and archegonia). It is rarely more than one tenth of an inch in length, is composed of cellular tissue, and bears the antheridia and archegonia on its under surface. After fertilization the obsphere remains for a time within the archegonium, and proceeds to grow by the ordinary processes of cell-multiplication, until finally it breaks through the walls of the archegonium differentiated into its first root and leaf. The young plant continues to draw its nourishment for a time from the prothallium, but it soon develops root-hairs which extend into the soil and render it independent of the prothallium, which, having accomplished its purpose, withers away. See *fern*[1], *Musci*, *Ophioglossaceæ*. Also *prothallus*, *protothallus*.

Diesing (1865) as foreshadowing or pretypifying the lowest worms of the metazoic series, as the turbellarians. The term regarded more especially the holotrichous ciliate infusorians, but included all the ciliate and flagellate forms, excepting *Vorticellidæ* and *Stentoridæ*, and is thus nearly synonymous with *Infusoria*. See cut under *Paramecium*.

Cf. *prosthesis*.] 1. In the *Gr. Ch.*: (*a*) The preparation and preliminary oblation of the eucharistic elements before the liturgy: more fully called the *office of prothesis*. This office is said responsively by priest and deacon. The priest signs an oblate with the holy lance, thrusts the lance into the right, left, upper, and lower sides of the holy lamb, lifts this off, cuts it crosswise, and stabs it. He then blesses the chalice which the deacon has prepared (mixed). Appropriate prayers and verses of Scripture accompany these rites. He then takes from the remainder of this and other oblates pyramidal pieces called *portions* of the Virgin Mary, apostles, martyrs, etc., the living and the dead, commemorating these classes, and arranging the portions in a prescribed manner on the disk (paten). Incense is then offered, the asterisk and veils placed over the elements, and the prayer of prothesis said. The elements are left in the chapel of prothesis till taken to the altar at the Great Entrance. (*b*) The table on which this preparation is made (the table or altar of prothesis). It answers to the Western credence-table. (*c*) The apartment or the part of the bema or sanctuary in which this table is situated and the office used (the chapel of prothesis). See *bema* and the cut there given.—2. In *gram.*, addition of one or more sounds or letters at the beginning of a word. Some Latin writers use this form for the Greek προσθεσις (see *prosthesis*) apparently through misapprehension, and some modern writers prefer it as more specific.

They are usually exceedingly minute plants, requiring the highest powers of the micro-cope for their study. The cells are in general poorly developed; the nucleus is wanting in many cases, and frequently there is either no cell-wall or an imperfectly developed one. They multiply most commonly by fission, the sexual organs being unknown or only very slightly differentiated. According to the classification of Bennett and Murray, the *Protophyta* embrace two groups — the chlorophyllous group, or *Schizophyceæ*, and the non-chlorophyllous group, or *Schizomycetes*. protoplasm (prō'tō-plazm), *n.* [< NL *protoplasma*, protoplasm, < ML. *protoplasma*, the first creation, the first creature or thing made (*protoplastus*, the first man made), < MGr. πρωτόπλασμα, < Gr. πρῶτος, first, + πλάσμα, anything formed or molded: see *plasm*.] An albuminoid substance, ordinarily resembling the white of an egg, consisting of carbon, oxygen, nitrogen, and hydrogen in extremely complex and unstable molecular combination, and capable, under proper conditions, of manifesting certain vital phenomena, as spontaneous motion, sensation, assimilation, and reproduction, thus constituting the physical basis of life of all plants and animals; sarcode. It is essential to the nature of protoplasm that this substance consist chemically of the four elements named (with or without a trace of some other elements); but the molecule is so highly compounded that these elements may be present in somewhat different proportions in different cases, so that the chemical formula is not always the same. The name has also been somewhat loosely applied to albuminous substances widely different in some physical properties, as density or fluidity. Thus the hard material of so-called vegetable ivory and the soft body of an amœba are both protoplasmic. The physiological activities of protoplasm are manifested in its irritability, or ready response to external stimuli, as well as its inherent capacity of spontaneous movement and other indications of life; so that the least particle of this substance may be observed to go through the whole cycle of vital functions. Protoplasm builds up every vegetable and animal fabric, yet is itself devoid of discernible histological structure. It is ordinarily colorless and transparent, or nearly so, and of glairy or viscid semifluid consistency, as is well seen in the bodies of foraminifers, amœbæ, and other of the lowest forms of animal life. Such protoplasm (originally named *sarcode*), when not confined by an investing membrane, has the power of extension in any direction in the form of temporary processes (see *pseudopodium*) capable of being withdrawn again; and it has also the characteristic property of streaming in minute masses through closed membranes without the loss of the identity of such masses. An individuated mass of protoplasm, generally of microscopic size, and with or without a nucleus and a wall, constitutes a *cell*, which may be the whole body of an organism, or the structural unit of aggregation of a multicellular animal or plant. The ovum of any creature consists of protoplasm, and all the tissues of the most complex living organisms result from the multiplication, differentiation, and specialization of such protoplasmic cell-units. The life of the organism as a whole consists in the continuous waste and repair of the protoplasmic material of its cells. No animal, however, can elaborate protoplasm directly from the chemical elements of that substance. The manufacture of protoplasm is a function of the vegetable kingdom. Plants make it directly from mineral compounds and from the atmosphere under the influence of the sun's light and heat, thus becoming the storehouse of food-stuff for the animal kingdom. Protoplasm appears to have been first recognizably described by Rosel, in or about 1755, in his account of the proteus-animalcule. It was observed, not named, seventeen years later by Corti, in the cells of *Chara*. Like motions of protoplasm were noticed by Meyen in 1827 in *Vallisneria*, and by R. Brown in 1831 in his discovery of the cyclosis in the filaments of *Tradescantia*. In 1835 Dujardin called attention to a "primary animal substance" in the cells of foraminifers, described as "a sort of slime" endowed with the property of spontaneous motion and contractility, and called it *sarcode*. The word *protoplasm* was first used (in the form *protoplasma*) by Hugo von Mohl, in 1846, with reference to the slimy granular semi-fluid contents of vegetable cells. The identity of this vegetable "protoplasm" with animal "sarcode," suggested in 1850 by Cohn, who regarded this common substance as "the prime seat of almost all vital activity," was confirmed by Schultze in 1861; Virchow had in 1858 abandoned the idea that a cell-wall is necessary to the integrity of a cell, holding that a nucleus surrounded by a molecular blastema (that is, protoplasm) constitutes a cell, and Schultze defined the cell as protoplasm surrounding a nucleus, which since that time the term has come into universal use. Also called *bioplasm*, *cytoplasm* or *cytioplasm*, and *plasmogen*. See these words, and cuts under *amœba* and *cell*, 5.

Hence this substance, known in Vegetable Physiology as *protoplasm*, but often referred to by zoölogists as sarcode, has been appropriately designated by Prof. Huxley "the Physical Basis of Life." *W. B. Carpenter*, Micros., § 219.

For the whole living world, then, it results that the morphological unit — the primary and fundamental form of life — is merely an individual mass of *protoplasm*, in which no further structure is discernible.
Huxley, Anat. Invert., p. 18.

Protozoa (prō-tō-zō'ä), *n. pl.* [NL., pl. of *Protozoön*.] Primordial or first-formed animals, or cell-animals; protozoans: a subkingdom of *Animalia* or prime division of animals, contrasted with *Metazoa*, or all other animals collectively. The *Protozoa* are animal organisms consisting of a single cell, or of several cells not differentiated into tissues. This is the essential distinction between protozoan and metazoan animals, though no hard and fast line can be drawn around *Protozoa* to distinguish them on the one hand from *Protophyta*, and on the other from *Metazoa*. The name *Protozoa* was first used by Goldfuss (1809) to include microscopic animals and also the polyps and medusæ. Siebold and Stannius first used it in its modern signification as comprising and limited to the infusorians and rhizopods. Owen (1859) used the term *Protozoa* for a kingdom including diatoms, etc., and therefore synonymous with *Protista*. The sponges, in the view (as held by W. Saville Kent, for example) that they consist essentially of an aggregate of choanoflagellate infusorians, are often brought under *Protozoa*, though they have not only an ectoderm and an endoderm, but also a mesoderm, and are therefore tissue-animals as distinguished from cell-animals. Excluding sponges, *Protozoa* may be characterized as animals composed of a simple nearly structureless jelly-like substance called *sarcode*, a kind of protoplasm, devoid of permanent distinction or separation of parts resulting from tissue-formation or histogenesis (though they may have very evident organs as parts of a single cell), without a permanent definitive body-cavity or any trace of a nervous system, no permanent differentiated alimentary system except in a most rudimentary state, and no multicellular membranes or tissues. Nevertheless, there is really a wide range of variation or gradation of structure in these seemingly structureless animalcules. Some of the lowest forms are mere microscopic specks of homogeneous sarcode, of any or no definite shape. Such are moners, or representatives of a division *Monera* or *Proteomyxa*; but it is not certain that all such objects are either individuals or species in a usual sense of these words. Among the lowest protozoans of which species and genera can be definitely predicated are the amœbiform organisms, which have a nucleus, and locomotory organs in the form of pseudopods, temporarily protruded from any part of the body, and which ingest and egest foreign substance from any part of the body. Vast numbers of protozoans are of this grade of complexity, and with the simpler forms constitute a class, *Rhizopoda*, including the normal amœboids and the foraminifers and radiolarians. For, though both these latter may have very complicated shells, tests, or skeletons, their sarcodous substance remains of a low and simple type. It is an advance in organization when a protozoan becomes *corticate* —that is, assumes a form in which an outer harder ectoplasm and an inner softer endoplasm are distinguishable —since this confines the sarcodous mass and gives it definite shape or form. This advance in organization is often marked by the appearance of a nucleolus or endoplastule, besides the nucleus or endoplast which most protozoans possess, by the presence of definite and permanent locomotory organs in the form of cilia or flagella, and finally by the fixation of a specialized oral or ingestive area or mouth, in place of the one or several temporary vacuoles which serve as stomachs in lower forms. Protozoans of this higher grade occur

under various forms. The class *Gregarinida* represents parasitic forms, one- or two-celled, essentially like the ova of *Metazoa*. The class *Infusoria* comprehends an enormous number of minute, nearly always microscopic, animalcules, found in infusions, inhabiting both fresh and salt water, sometimes parasitic, but mostly leading an independent fixed or free life. There are many groups of these, as the ciliate, flagellate, choanoflagellate, and suctorial infusorians, among them the most complex organisms which are commonly included under *Protozoa*, as the *Noctiluca*, for example. With or without some of the lowest disputed forms, and with or without the sponges, *Protozoa* have been very variously subdivided, almost every author having his own arrangement. A so-called moner, an ameba, a foraminifer, a radiolarian, a gregarine, and an infusorian respectively exemplify as many leading types of *Protozoa*. One division is into *Astomata* and *Stomatoda*, according to the absence or presence of a mouth. Another is into *Monera* and *Endoplastica*, according to the absence or presence of a nucleus, the latter being again distinguished as *Myxopoda* and *Mastigopoda*, according to whether the locomotory organs are temporary pseudopods or permanent cilia or flagella. A third is into *Gymnomyxa* and *Cortica'a*, according to the absence or presence of a distinguishable ectoplasm. (1) The *Gymnomyxa* are separated into 7 classes: *Protomyxa* (indefinable), *Mycetozoa* (often regarded as plants), *Labyrinthulidea*, *Heliozoa* (sun animalcules), *Reticularia* (the foraminifers), and *Radiolaria*. (2) The *Corticata* are divided into 6 classes: *Sporozoa* (gregarines and many others), *Flagellata*, *Dinoflagellata*, *Rhizopodozoa*, *Ciliata*, and *Actinozoria*, the last five being as many classes of infusorians. This is the classification presented in the latest edition of the Encyclopedia Britannica. By Saville Kent the *Protozoa* (including sponges) are divided into 4 prime evolutionary series, not exactly coincident, however, with any recognized zoological groups, called *Pantozoomata*, *Dissostomata*, *Enstomata*, and *Polyplastomata*, (see these words.) Also called *Hapazoa*, *Oözoa*, *Plastidozoa*. Compare *Primalia*, *Protista*, *Pyrophyta*. The original meaning of *mashal,* the Hebrew word translated 'proverb,' seems to be 'a comparison.' They formed one of the most characteristic features of Eastern literature.

small trees, sometimes shrubs, bearing alternate undivided leaves, usually finely toothed and folded lengthwise by the midrib (conduplicate) in the bud. The white, pink, or rose-colored flowers are in umbel like clusters or racemes, or sometimes solitary. Many of the most valuable fruit-trees belong to this genus, including the peach, apricot, cherry, and plum. Many are used as febrifuges or for other medicinal properties. A gum exudes from their bark, especially in the cherry. Nearly all parts contain the elements of prussic acid, rendering the kernels and bark of some species poisonous if eaten freely, particularly the wilted leaves and young branches of some cherries. One fourth of the known species are American, of which 14 are found east and 6 west of the Rocky Mountains. Mexico is the home of a remarkable group of 6 species (section *Lampetocladus*, Torrey), extending to Utah and California, with velvety fruit, smooth stone, and solitary or two in flowers appearing with the leaves, somewhat akin to the almond. The section or former genus *Amygdalus* has a downy fruit, rough and wrinkled stone, conduplicate vernation, and flowers preceding the leaves, and includes about 10 species, natives of warmer Europe and Asia, of which the type is *P. Amygdalus* (*A. communis*), the almond. (See *almond, almond-tree, Amygdalus,* and *amygdalin.*) Its variety *amara*, the bitter almond, is the source of a well-known essence. *P. Persica*, the peach, is now placed in this section also. (See *peach*[1], *nectarine, clingstone,* and *Persica.*) The apricot section, *Armeniaca* (Tournefort, 1700), is similar in its downy drupe and flowers preceding the leaves, but differs in its smooth stone and convolute vernation. It includes *P. Armeniaca*, the apricot; *P. Sibirica*, the Siberian apricot, valued for its earlier and ornamental flowers; *P. dasycarpa*, the black apricot, also Siberian; and *P. Brigantiaca* from Briançon in France, known as the *marmotte-oil tree*, from the oil expressed from its kernels and used like olive-oil. The section *Prunus* proper, including the plums of the Old World, has a short calyx, smooth fruit, usually with a bloom, a flattened stone, and solitary or twin flowers preceding or accompanying the leaves, which are convolute in the bud, as in *P. domestica*, the cultivated plum, and its probable original, *P. spinosa*, the sloe or blackthorn. (See *plum*[1].) The related *P. cocomilia* of Calabria is valued in Italy as a remedy for fever. The plums of the New World differ in their conduplicate vernation, fruit with little or no bloom, and in some species very turgid stones, approaching those of the cherry, as in *P. Americana*, the red or yellow plum of the Atlantic States (also called *Canada plum* and *horse-plum*); *P. maritima*, the beach-plum; *P. subcordata*, the wild plum of California; and *P. angustifolia* (*P. Chicasa*), the Chickasaw plum, or hog-plum. The cherry section, *Cerasus*, known by its smooth fruit without a bloom, conduplicate vernation, and solitary clustered or umbeled flowers preceding or accompanying the leaves, includes about 20 species, of which *P. Cerasus* is the parent of the red and many other garden cherries. Pennsylvanica*, the wild red cherry, pin-cherry, or pigeon-cherry. (See *pin-cherry.*) The section *Padus* contains cherries with racemed flowers following the leaves, and smaller, less edible fruit, as *P. Padus* of Europe, known as *bird-cherry*, and 4 American species, *P. Capuli* and *P. demissa*, the wild cherries, respectively, of Texas and the Rocky Mountains; *P. serotina*, the black cherry, rum-cherry, or cabinet-cherry (see *rum-cherry*); and *P. Virginiana*, the choke-cherry. Another section, *Laurocerasus*, suggests the true laurel in its evergreen leaves, and has racemed flowers with a short obconical calyx, a conduplicate vernation, and a small, smooth, inedible berry-like fruit. It includes about 30 species, both temperate and tropical, mainly American, as *P. occidentalis*, the West Indian laurel or prune tree; the Californian *P. ilicifolia*, the islay, also called *holly-laurel*; and *P. Caroliniana*, the Carolina cherry-laurel, also known as *wild orange* and *wild peach.* (See *orange*[1] and *peach-brake.*) For the long-cultivated *P. Laurocerasus*, type of this section, also known as *cherry-bay, laurel-cherry,* and *date of Trebizond*, see *cherry-laurel*, also *laurel-water.* The Versailles laurel of gardens is a variety of this. *P. Lusitanica* is the Portugal laurel. A species similarly valued for the beauty of both its leaves and flowers is *P. pseudepigrapha (sū-de-pig'ra-fä), *n. pl.* [NL., < Gr. *ψευδεπίγραφα*, neut. pl. of *ψευδέπίγραφος*, falsely inscribed or ascribed: see *pseudepigraphous*.]

Spurious writings; specifically, those writings which profess to be Biblical in character and inspired in authorship, but are not adjudged genuine by the general consent of scholars; those professedly Biblical books which are regarded as neither canonical nor inspired, and from their character are not worthy of use in religious worship. Biblical literature is divided into three classes: (*a*) The canonical and inspired; (*b*) the non-canonical and uninspired, but on account of their character worthy of use in the services of the church; (*c*) those which, though Biblical in form, so vary from the Biblical writings in spirit that they are not deemed worthy of any place in religious use. The second constitute the apocrypha, the third the pseudepigrapha. Thus, what is sometimes known as the New Testament Apocrypha, being not considered worthy of regard by any branch of the Christian church, properly consists of pseudepigrapha.

In the form characteristic of Greek masonry, in which, however, the pseudisodomon is usually earlier or (especially) later than the best time, the courses are alternately thick and thin, all the thick courses being of the same thickness, and so with all the thin courses. Masonry of this kind is frequent in Roman work

pseudo-, [Before a vowel sometimes *pseud-*; < Gr. ψευδο-, ψευδ-, combining form of ψευδής, false, sham, deceitful, ψεῦδος, a falsehood — or rather of the orig. verb, ψεύδειν, lie, cheat, deceive.] An element, a quasi-prefix, in compounds of Greek origin, meaning 'false,' 'counterfeit,' 'spurious,' 'sham.' It is freely used as an English prefix, with words of any origin, and by no means all the compounds made with it are given below. In scientific compounds it implies something deceptive in appearance, function, or relation. Thus, in crystallography, it is used in such compounds as *pseudo*-isometric, *pseudo*-tetragonal, etc., to describe crystals which appear to belong to the isometric, tetragonal, etc., systems, but in fact belong to a system of lower grade of symmetry. (See *pseudosymmetry.*) In biology it is much used (like *quasi-*) to indicate deceptive likeness of things really quite unlike; but it frequently implies a real resemblance so close as to obscure or hide actual difference.

In *bot.*, a form-genus; a genus based upon apparent species which are really only stages in the life-cycle of species of other genera. Many of the so-called genera of fungi, bacteria, etc., are *pseudo-* or *form-genera*. See *form-genus*, and compare *form-species*.—2. In *zoöl.*, a spurious genus. Pseudogenera, or pseudogeneric names, may be due to (*a*) the imagination, as when hypothetical or supposititious ancestral forms, of which nothing is actually known, are named as genera (see several cases among words beginning in *Pro-*, *Proto-*); (*b*) defect or error of observation, particularly of microscopic objects liable to look different when differently manipulated; (*c*) defective or mutilated specimens accurately described but mistaken for normal examples of their kind; (*d*) natural monstrosities not recognized as such; (*e*) normal stages of growth or development of any organism mistaken for a different organism. Many pseudogenera of class (*e*) have been named among animals which undergo marked or peculiar transformations from the embryo to the adult, not understood by the observer at the time, as many cœlenterates, echinoderms, crustaceans, etc., and even some vertebrates, as fishes and batrachians. Pseudogenera in the above senses are all foreign to the question of what degree of difference shall be accounted generic, and also of any question of priority or other nomenclatural rule. Those of class (*a*) have such standing as one may choose to allow them. Those of class (*b*) can have no standing. In classes (*c*) and (*d*) pseudogeneric names may hold if they can be identified and properly recharacterized (and are not obnoxious to any rule of nomenclature). The large class (*e*) of cases based upon literally "larval" or masked forms of organisms whose adults are already named generically has no claim to recognition among New Latin genera properly so called. But many such pseudogeneric words are conveniently retained in a modified sense as English names of the objects which they designate. See, for examples, *Bipinnaria, Brachiolaria, Cysticercus, Leptocephalus, Megalops, Nauplius, Phyllosoma, Zœa*.

Sometimes quartz is found in the form of fluor-spar crystals, the fluor-spar having been changed by a process of substitution into quartz. Such crystals are pseudomorphs by substitution; another illustration is that of tinstone, cassiterite, after orthoclase feldspar. A more common and important class of pseudomorphs includes those formed by the chemical alteration of the original mineral: these are illustrated by pseudomorphs of native copper after the oxid cuprite, where there has been a simple loss of one ingredient, in this case oxygen; also, of gypsum after anhydrite, where the anhydrous calcium sulphate has been changed by assumption of water to the hydrous sulphate; or, still more important, where there has been a more or less complete exchange of constituents, as of the lead carbonate cerusite after the lead sulphid galena, or of serpentine after chrysolite, or of kaolin after feldspar, etc. Pseudomorphs are also formed by molecular change without change of chemical substance, as of calcite after aragonite, or rutile after brookite; these last are also called *paramorphs.* (See *paramorphism.*) Pseudomorphs very commonly have a noncrystalline waxy structure, but this is not necessarily the case.

pseudopodium (sū-dō-pō'di-um), *n.*; pl. *pseudopodia* (-ä). [NL., < Gr. *ψευδής*, false, + *ποῦς* (*ποδ-*) = E. *foot*.] 1. In *Protozoa*, as pseudopods, rhizopods, or myxopods, a temporary diversiform prolongation or protrusion of the sarcode or body-substance of the animalcule, to any extent or in any shape, capable of being withdrawn or reabsorbed into the general mass of the body, and serving as an organ of locomotion, prehension, or ingestion; a pseudopod, or false foot: generally in the plural. The term is very comprehensive in its application to foot-like, finger-like, or ray-like processes of the body of protozoans; but it is the essential character of a pseudopodium to be soft, diversiform, or variable in shape, and temporary, or subject to reabsorption—in which respects the organ differs from the fixed or constant processes of many protozoans, as cilia or flagella. Pseudopodia are highly characteristic of the lower or non-corticate protozoans, the myxopods or rhizopods proper, as all the amœbiforms, the heliozoans, the foraminifers, etc. They may be broad and lobate processes of sarcode, or slender filamentous rays. When lobate the pseudopodia remain distinct from one another, their margins are clear and transparent and the granules which they may contain plainly flow into their interior from the more fluid central part of the body, or the whole body of the animalcule may flow into such a pseudopod, thus effecting a peculiar kind of locomotion. But when they are filiform they are very apt to run into one another, and give rise to networks, the constituent filaments of which, however, readily separate and regain their previous form; and, whether they do this or not, the surfaces of these pseudopodia are beset by minute granules, which are in incessant motion. See cuts under *Actinosphærium*, *Amœba*, and *Rotalia*.

The unimpregnated eggs laid by a virgin aphis are pseudova. The delicate investing membrane or cell-wall is ruptured immediately by the active embryos.

One of the hindermost of these cells enlarges and becomes detached from the rest as a *pseudovum*. It then divides and gives rise to a cellular mass, distinguishable into a peripheral layer of clear cells and a central more granular substance, which becomes surrounded by a structureless cuticula. It is this cellular mass which gradually becomes fashioned into the body of a larval aphis.

Shakspeare was pursuing two Methods at once; and, besides the *Psychological* Method, he had also to attend to the Poetical. . . . We beg pardon for the use of this insolens verbum; but it is one of which our Language stands in great need. It is said to have originated with Pythagoras. Aristotle greatly improved it, and stated its most important principle, that of the association of ideas. It has, however, only recently taken the position of a universally acknowledged science; and its methods are still in dispute. Some psychologists hold that we know the mind by direct intuition in consciousness; others, distinguishing between consciousness and self-consciousness, hold that the former involves no recognition of the mind, while the latter is not an original power, but only acquired knowledge. But, though such inward vision be denied, most psychologists still consider the observation of what passes within us as the main foundation for psychology. Others regard introspection as too deceptive to be of much use, and some deny its possibility. A few psychologists only, since Descartes, have held that the distinctions we naturally draw about mental functions—as, for example, between thinking and willing—have, in good part at least, a real significance. The great majority have denied this, explaining that the faculties are nothing in the soul (which itself has no parts), but are mere conveniences of description. Nevertheless, these writers are accused by many modern psychologists of practically assuming that our natural ideas of mind are in some approximate harmony with the facts of mind, just as physicists assume that among the conceptions which appear simple and natural to man are likely to be found those that are embodied in laws of nature. The prevalent school of modern psychologists attributes great importance to systematic experimentation by one person upon another, especially to quantitative determinations, as of the time occupied in different mental processes, the force required to produce sensations of given intensity, and the like; yet some of the older generation predict that the utility of this method will be found to have narrow limits. Psychology has also been pursued by means of extensive observations upon persons in abnormal mental states, upon persons having some mental peculiarity, upon the development of the minds of children, upon the languages, institutions, mythology, and arts of different races, and by means of the comparative study of biography. Psychology has often been divided into psychography, psychonomy, and psychosophy. See the somewhat deceptive quotation from Coleridge, 1817, under *psychological*, and the first quotation below.

Under the general term [physiology] I also comprehend natural theology and *psychology*, which in my opinion have been most unnaturally disjoined by philosophers.

In fishes there are several different pterygoid bones, entering into the formation of the pterygopalatal bar or palatoquadrate arch, and distinguished as *entopterygoid*, *ectopterygoid*, and *metapterygoid*: see these words, and cut under *palatoquadrate*. Ptolemaic (tol-e-mā′ik), *a.* [⟨ Gr. Πτολεμαϊκός, pertaining to Ptolemy, ⟨ Πτολεμαῖος, Ptolemy: see def.] Of or pertaining to Ptolemy; (*a*) relating to one or all of the line of Ptolemies, rulers of Egypt from the end of the fourth to the first century B. C.; (*b*) relating to the Alexandrian geographer and astronomer Ptolemy (see below).—**Ptolemaic chart.** See *Bonne's map-projection*, under *projection*.—**Ptolemaic system**, the structure of the heavens according to Ptolemy, an Egyptian-Greek astronomer, whose recorded observations extend from 127 to 151 A. D. His "Treatise of Mathematics" (Μαθηματικὴ σύνταξις), commonly called the "Almagest," is mainly devoted to an investigation of the movements of the heavenly bodies. Ptolemy holds that the earth is stationary, because there is no appearance of variation in the perspective of the fixed stars. He admits it would simplify astronomy to suppose it rotated daily on its axis, but thinks that refuted by physical considerations, while, regarding the stars as devoid of weight, he sees no objection to supposing them to move with immense velocity. But these two errors of denying the motion of the earth both in translation and in rotation were not incompatible with a correct representation of the motions of the planets relatively to the earth. The figure shows his theory of Mars, which was exactly like that of Jupiter and Saturn. He supposed that about a circular deferent, which was really nearly similar and similarly placed to the true orbit of the planet about the sun, moved an epicycle, which was really of nearly the same proportionate size as the earth's true orbit and parallel to it—this epicycle carrying the planet on its circumference. In the figure, T is the earth; XDIYJ, the orbit, deferent, or eccentric of Mars; C, the center of the orbit; GH, the equant; E, its center; AKPL, the epicycle; D, its center; ♂, Mars; IJ, the line of nodes of the orbit; KL, the line of nodes of the epicycle (which is parallel to the ecliptic) upon the plane of the orbit. Mars revolves upon the epicycle so as to move uniformly relatively to P, the perigee of the epicycle, which it reaches so as to be then in opposition to the mean sun. The center D of the epicycle moves about the orbit so as to describe in equal times equal angles about E, the center of the equant. C, the center of the orbit, bisects the eccentricity ET. The essential errors in his representation were as follows. (1) He represented the deferent by the circle, thus giving it a breadth too great. This circle remained in an eccentric position, whence it was called the *eccentric*, as well as the *deferent* and the *orbit*. (2) Instead of supposing the moving radius, TD, to describe equal areas in equal times, he drew a line to D, the attachment of the epicycle with the deferent, from P, really corresponding to the empty focus of the ellipse, but called by him the *center of the equant*, and he supposed this line ED to turn with an equable motion so as to describe equal angles in equal times. This made an observable error only in the case of Mars. It made a tolerable approximation to the elliptic motion, which excited the admiration of Kepler, and it shows that Ptolemy aimed at something much better than a mere harmonic analysis of the motions of the planets. (3) He not only made the epicycle circular, but he placed its center upon the deferent, thus virtually neglecting the eccentricity as well as the ellipticity of the earth's orbit in its effects on the apparent places of the exterior planets. (4) He made the planet revolve in its epicycle so as to describe in equal times equal arcs measured from the perigee of the epicycle, as if the earth's motion were affected by the eccentricity of the orbit of the other planet. And (5) he made the planet come to the perigee of its epicycle when it was just opposite the mean place of the sun, instead of the true place. Other still more serious falsities affected his theories of the inferior planets and of the moon. Yet, notwithstanding all these errors, Ptolemy's theory satisfied pretty closely, in the cases of all the planets except Mercury and the moon, such observations as could be made in his time. In his phrase, it "saved appearances." The Ptolemaic theory continued in vogue until Copernicus (in 1543) explained the relations between the motions of the planets and that of the sun, and thus supplied a method for determining the relative magnitudes of the different planetary orbits. But the system of Copernicus did not in itself represent the phenomena any better than that of Ptolemy; and it was not until the great work of Kepler on the motions of Mars, published in 1609, that the real truth was known. The Almagest remains, however, a model of scientific investigation, most admirable for the genius with which it manages not only the astronomical problems attacked, but also those of pure mathematics.

Ptychosperma (tī-kō-spėr'mȧ), *n.* [NL. (Labillardière, 1808), < Gr. πτύξ (πτυχ-), πτυχή, a fold, + σπέρμα, seed.] A genus of palms of the tribe *Arecæ*, type of the subtribe *Ptychospermeæ*. It is characterized by monœcious flowers, both sexes within the same spadix, the staminate flowers having orbicular concave broadly imbricated and heeled sepals, acute petals as many as the sepals, and from twenty to thirty stamens—the pistillate flowers being smaller, nearly globose, and having a single ovary which becomes a one-celled fruit whose thick fibrous pericarp contains a single erect seed with ruminate albumen and a smooth or deeply five-grooved surface. The 11 species are natives of the Malay archipelago, Papua, Australia, and the islands of the Pacific. They are thornless palms, with a tall trunk marked by annular scars, and terminal pinately divided leaves with the segments commonly dilated to the broad apex and there erose, or appearing as if eaten off. The flowers are small, and are borne in clusters on the slender spreading branches of a spadix inclosed by two spathes. The species are of little known industrial use, but rank among the most elegant of decorative palms. Those in greenhouse cultivation are sometimes called in general *feather-palms*, and very often *Seaforthia* (R. Brown, 1810), from Lord Seaforth, a patron of botany. *P. Seemani*, a beautiful dwarf species, produces a stem only about one inch in diameter and very strong and straight. Most of the species reach a commanding height: among them *P. Alexandræ*, the Alexandra palm, is remarkable as the tallest palm of Australia, exceeding 100 feet in height; *P. Cunninghamii*, the Illawarra palm, as found further south than almost any other palm; and *P. (Seaforthia) elegans*, the bungalow palm, as the most common in cultivation, and one of the most beautiful of all palms. The trunk of the last-named species is a smooth cylindrical shaft, swollen at the base and crowned by drooping feather-like leaves of a bright and intense green. Each leaf-stalk is dilated at the base into a smooth bright-green sheath completely inclosing the upper part of the trunk for 5 feet or more, below which the trunk is variegated by the broad deep-brown ring-like scars left by the preceding similar sheaths. This palm occurs in the coast forests of tropical Australia and to 35° south. See *palm*², and under it *Alexandra palm*, *bungalow palm*, and *feather palm*.

Plants of this genus exhibit the phenomenon of heterœcism—that is, they pass through different stages of their life-history upon different host-plants. *P. graminis*, one of the commonest and most destructive species, may be taken as a type. It appears in the spring on the leaves of *Berberis vulgaris*, constituting what is known as *barberry-rust* or *barberry cluster-cups*. This is the recidial stage, and received the name of *Æcidium Berberidis* before the heterœcism was suspected. Later in the season the uredo stage makes its appearance on the leaves and stems of the cultivated oats, wheat, etc., appearing as pale-yellowish or whitish spots on the leaves. Soon the tissues are ruptured, and the long lines of orange-red uredospores are exposed, now constituting the red rust of oats, etc. By the rapid germination of the uredo-spores the disease is quickly spread, and may involve the entire plant. In the fall, just before cold weather, the black teleutospores are produced. This is known as the black rust, and is designed to carry the fungus over the winter, when it again begins its life-cycle on the barberry. About 450 species of *Puccinia* are known, not a few of which are serious pests to the agriculturist or horticulturist. See *heteræcism, barberry-fungus, rust, Uredineæ*.

See *Danks rotary furnace*, under *furnace*.

puddling (pud'ling), *n.* [Verbal n. of *puddle*[1], v.] 1. In *hydraul. engin.*, the operation of working plastic clay behind piling in a cofferdam, the lining of a canal, or in other situation, to prevent the penetration of water; also, the clay or other material used in this operation.—2. The operation of transforming pig-iron into wrought-iron in a reverberatory furnace. The object of puddling is to remove the carbon in the pig-iron; and this is effected partly by the direct action of the oxygen of the air at the high temperature employed, and partly by the action of the cinder formed, or the oxidized compounds of iron added during the process. After the iron "comes to nature" in the furnace, it is made up into balls for convenient handling; these are "shingled" by hammering or squeezing, and passed between rolls, by which the metal is made to assume any desired form. There are two methods of puddling: the process as originally performed is called *dry puddling*; that which is now most generally followed is known as *wet puddling*, but is oftener called *pig-boiling*. In the older process only white or refined iron could be used; in the newer unrefined iron is employed, and this melts more perfectly and boils up more freely than is the case when refined iron is used, which remains in a more or less pasty condition during the process; hence the name *pig-boiling*. The puddling process was invented in England by Henry Cort, about 1784, and he was also the inventor of the method of finishing iron by passing it through grooved rolls—processes of immense importance as determining the long-maintained supremacy of England in the iron-manufacturing business. The invention of what is known as "Bessemer steel" has considerably diminished, and is likely still further to diminish, the relative importance of the puddling process.—**Mechanical puddling**, the substitution for hand-labor of some one of the various mechanical contrivances which have been invented to make the operation of puddling less fatiguing for the workmen. Various methods of mechanical puddling have within the past few years come more or less extensively into use: one is to arrange the tools so as to imitate manual rabbling (see *rabble*[3]) as nearly as possible; in the other method some form of rotating or oscillating hearth is employed, the motion of which replaces the operation of rabbling. See *Danks rotary furnace*, under *furnace*; also (under the same heading) *Pernot furnace*, a form which has been employed for puddling iron as well as for making steel.

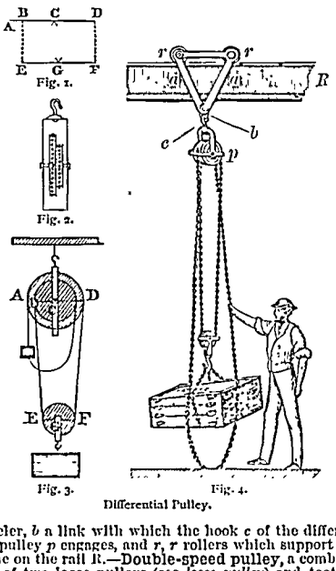
(*b*) A block containing several grooved wheels. (*c*) A tackle or apparatus consisting of one or more pulley-blocks with a rope or ropes reeved through them for use in hoisting. The pulley is a lever with equal arms; but when it turns, the attachments of the forces are moved. Fig. 1 shows a fixed pulley. The equal weights *d* and *e* are in equilibrium, because they hang from the equal arms of the lever *ab*, having its fulcrum at *c*. Fig. 2 illustrates the principle of the movable pulley. The equal-armed lever, with fulcrum at *c*, has on one arm the weight *d* and on the other the force of the stretched string *bc*. If there is equilibrium, this force must be equal to the weight of *d*. Thus, the total downward pull on *f*, one arm of the equal-armed lever *fg*, with fulcrum at *h*, is twice the weight of *d*, which must, therefore, be the weight of *i* to keep it in balance. We may also use the axiom that when a cord is free to move along its length it must be under equal stress in all its parts. Consequently, when a movable block is supported by a number of parallel parts of the same cord,



Pulleys.

these must bear equal shares of the load. Thus, in fig. 3, the lower block with the weight *b* brings equal strains upon four stretches of the cord, one of which is balanced by *a*. Consequently, the weight of *b* is four times that of *a*. But the effects of friction and of the stiffness of the cord are of great importance in the calculation of the advantages of pulleys. There is a great mechanical advantage in having separate blocks for all the movable pulleys, as in figs. 4 and 5. Thus, in fig. 4, the weight *a* is balanced over the lowest pulley by the pull on *b*, and the sum of these forces drawing down the lowest pulley is balanced over the second pulley by the pull on *c*, which is therefore double the weight at *b*. Thus, by means of four pulleys *a* balances $a + 2a + 4a + 8a = a(2^4 - 1)$, or fifteen times instead of (as by the arrangement of fig. 3) only four times its own weight. Another arrangement is shown in fig. 5. Here, by means of four pulleys, *a* balances eight times its own weight.

Let AD (fig. 1) be a lever, having its fulcrum at C, half-way between A and D. From D and B (a point on AC) cords are attached to the equal arms of the lever EF, with fulcrum at G. Then, if weights are placed on A and G so as to balance one another, G is practically supported at the point half-way between B and D. The ratio of the weight at G to that at A is therefore 2 AC (CD − BC). The differential pulley has above one solid wheel with two grooved rims, the lower one being furnished with spikes to enter the links of a chain and prevent it from running over the wheel (see fig. 2). An endless chain is reeved upon this and upon a pulley below,

Specifically—(*a*) The soft, succulent part of fruit: as, the *pulp* of an orange, or of a grape. In the American grape of the *Vitis Labrusca* varieties (as Concord, etc.) the pulp is a distinct portion of the berry inclosing the seeds, and is characteristically tough and sour. To the compressibility and elasticity of this pulp is mainly due the action of the disks in serving as buffers to diminish concussion of the spine. The pulp is compressible enough to account also for the fact that a man may be appreciably taller in the morning after lying all night than in the evening after a day spent on the feet. (*f*) In *mining*, slimes; ore pulverized and mixed with water.

In the case of silver the ore is frequently pulverized by stamps, and the resulting *pulp* amalgamated in pans or barrels. *Encyc. Brit.*, XVI. 465.

2. Specifically, in *physiol.*, the series of rhythmically recurring maxima of fluid tension in any blood-vessel, consequent on the contractions of the heart. These may be perceived by palpation, and recorded by the sphygmograph, and often produce a visible effect in dilating the vessel, or causing a lateral movement of it. The pulse is for the most part confined to the arteries, but a venous pulse occurs (see below). There is one arterial pulse for each ventricular systole; but in disease a ventricular systole may be too feeble to produce a sensible pulsation in a distant artery, as at the wrist, or again each pulsation may be double. (See *dicrotic pulse*.) The features of the pulse are the times between successive pulsations, the maxima and minima of pressure, and the way in which the tension changes from maximum to minimum and to maximum again, represented in the form of the sphygmographic tracing. The normal pulse exhibits approximately equal and equidistant maxima, the rate being in adults between 70 and 80 (see *pulse-rate*); the rise of pressure is sharp, the fall slow with only a slight dicrotic wave; the extent of change (amplitude) is not excessive; and the tension of the blood in the vessel is neither too high nor too low. As taken with Basch's sphygomanometer, the radial (maximum) tension in health usually lies between 135 and 165 millimeters mercury.

He perceyuede by his *pous* he was in peril to deye,
And bote he hadde recouer the rather that rise sholde he neuere. *Piers Plowman* (C), xx. 66.

pulse-rate (puls'rāt), *n.* The number of pulsations of an artery in a minute. The normal pulse-rate of man in adult life, reclining, and undisturbed by exertion, averages, for the time between breakfast and retiring at night, about 72. There is a large diurnal variation, the rate falling to 60 or below during the night, and rising to 75 or more at noon or some other time during the day. The rate is from 140 to 120 or less during the first year of life, falls in the next year to 100, and reaches the adult rate shortly after puberty; after 60 years of age there is a slight increase. The pulse-rate of woman is 3 to 5 beats higher than that of man. Height of stature diminishes pulse-rate. The rate during health varies greatly, from unknown causes, in different persons—some rates being 40 or less, and others 100 or more, without inconvenience or other derangement of health. The pulse-rate is higher in a standing than in a sitting, or, still more, in a recumbent posture. It is raised by excitement, by exertion, by pyrexia, by various drugs and diseases.

pulsometer (pul-som'e-tėr), *n.* [< L. *pulsus*, a beating, + Gr. *μέτρον*, measure.] 1. Same as *pulsimeter*.—2. In *mech.*, a kind of steam-condensing pump acting on the principle of a vacuum-pump. By interposing a stratum of air between the steam and the water it forms a far more economical machine than the old style of vacuum-pump. In the illustration *a* and *a'* are bottle-shaped chambers; *b* is the bonnet with steam passages; *c* is a spherical valve which excludes the steam from one chamber while permitting it to flow into the other. Steam enters at *s*; *d* is an induction-passage for water; *e* and *e'* are vulcanized rubber valves; *f* and *f'*, valve-seats; *h*, the delivery-passage, shown (with other parts) in dotted outline; *g* and *g'*, eduction-valves for water; *i* and *i'*, valve guards; *j*, an air-chamber; *k* and *k'*, bonnets covering openings whereby the valves may be reached for adjustment or repair; *l* and *l'*, rods which hold the induction-valves and their attachments in place; *n* and *n'*, brass socket-headed bolts which secure the valves *g* and *g'* and their attachments in their places. Into the neck of each of the chambers *a* and *a* is screwed a small inlet air-valve (not shown). A similar valve is fitted to the chamber *j*. Steam entering chamber *a* expels its contents, and then, condensing, forms a partial vacuum. The valve then closes the opening into that chamber, and admits steam into the other. Water then rises to fill the vacuous chamber; also a little air enters through the minute air-valve in the neck. By this time the contents of the other chamber are expelled, the steam condenses therein, and other events follow as described for the first chamber. The small quantity of air admitted, being heavier than steam, forms a film over the upper surface of the water, and, being a non-conductor of heat, prevents wasteful condensation of steam, which would otherwise arise from the direct contact of the steam with the water. The machine derives its name from the pulsatory action of the steam ejected, and the analogy of its form, with its interior valves, to the construction of the heart. Also called *aquameter*.

Pulsometer, shown in section.

See *pulse*.—**Pulsus quadrigeminus**, a pulse in which there is a longer pause after every four beats.—**Pulsus tardus**, a slow pulse. See *pulse*.—**Pulsus tremulus**, a very feeble pulse just perceptible at the wrist as a faint fluttering sensation.—**Pulsus trigeminus**, a pulse with a longer pause after every three beats.—**Pulsus venosus**, the alternating expansion and contraction of a vein or veins, either due to the contractions of the heart acting backward through the large veins, or constituting a direct centripetal pulse due to arterial relaxation.

(*a*) A hydraulic machine for raising liquids from a lower to a higher level through a pipe or passage by means of one or more pistons or plungers (with or without valves), or analogues of these devices, working in, or in correlation with, one or more pump-barrels, pump-stocks, chambers, or confined spaces. Of this class the common single-acting house-pump, the details of which are shown in the cut, is a familiar example. (*b*) A hydraulic machine for forcing liquids under pressure through one or more pipes or passages, in any direction, by means of one or more pistons or plungers, or analogues of these devices, working in one or more cylinders, trunks, pump-barrels, pump-stocks chambers, or confined spaces. In *jet-pumps*, the analogue of the piston is either a liquid column moving at high velocity to force other portions of liquid or vapor forward, or a column of air, gas, or vapor, which, in the steam injector and ejector, is steam that is condensed to a liquid during its movement without much reduction in its velocity.]

In a marine engine the water is taken from the sea, made to circulate through the condenser, and then thrown overboard. — **Dental pump**, a device for freeing the mouth from saliva during dental operations. Also called *saliva-pump*. — **Differential pump.** See *differential*. — **Double-acting pump**, a pump which, instead of discharging and inducting liquid in its outward stroke only, both inducts and discharges at each stroke. An inlet- and an outlet-valve is arranged at each end of the pump; the piston is solid and valveless; an induction branch-pipe or passage leads to each inlet-valve; and a discharge branch-pipe or passage leads from each outlet-valve. — **Eccentric pump**, a cylinder in which revolve a hub and axis arranged eccentrically The water enters by one opening and escapes by another, expelled by flaps upon the hub, which serve as pistons in the space between the hub and case. — **Jack-head pump**, a pump having its delivery-pipe attached to the pump-barrel or -cylinder by a gooseneck connection This form of attachment is used especially in lifting-pumps for raising water from deep shafts or borings. — **Mercurial pump.** See *mercury air-pump*, under *mercury*. — **Oscillating pump**, a form of pump in which a vessel incloses two valved sectors or vibrating chambers that oscillate upon a pivot under the control of a handle or lever. It operates by the oscillation of the sector-shaped pistons, which alternately suck water into and discharge it from the inclosing vessel. — **Pendulum pump.** See *pendulum*. — **Pump-joint machine**, a machine for fitting together the joints of pump-stocks, by boring out and turning down the joining ends to form a socket-joint. — **Rotary pump**, any pump that acts by the rotary motion of the part or parts that force the liquid forward. See cut under *centrifugal*. — **Saliva-pump.** Same as *dental pump*. — **Single-acting pump**, in contradistinction to *double-acting pump*, a pump that inducts and discharges during one stroke only — the outward stroke. Compare *stroke*. — **Spiral-pump.** Same as *Archimedean screw* (which see, under *Archimedean*). — **Steam jet-pump**, a jet pump in which water is driven by steam. In the case of the injector this form of pump is used to feed water to the boiler. See *injector* and *ejector*, which are special names for steam jet-pumps. — **Steam vacuum-pump.** See *vacuum-pump*. — **Submerged pump**, a pump the barrel and valves of which are submerged, while its pump-rod and discharge-pipe extend above the surface of the water in which the pump-barrel is placed The principal advantage pertaining to submerged pumps is that their working parts are not liable to be obstructed by the formation of ice (called *freezing up*), as is the case with pumps exposed to effects of very cold air. — **To fetch a pump.** See *fetch*. — **To prime a pump.** See *prime*. (See also *air-pump*, *chain-pump*, *filler-pump*, *force-pump*, *jet-pump*.)

Oscillating Pump

The body of the pump is made in two sections, *a* and *b*, flanged and bolted together. The induction chamber *c* has upwardly opening valves *d*, *d*, through which water is drawn by oscillating the handle *B*, causing corresponding oscillation of the piston *f f*, which turns upon *f* as a center, and is provided with valves *i*, *i*, opening upwardly into the chamber *l*, into which the water is forced at each successive oscillation, and discharged therefrom through the eduction-opening *k*.

Pumping of the barometer, the oscillation of the mercury in the tube of a barometer, resulting from sudden movements of the instrument, or sometimes from the mechanical influence of blasts of air in compressing or rarefying the air when the barometer is placed near an obstruction. At sea, where the barometer is subject to the pitching and rolling of the vessel, pumping is especially troublesome, and, in order to diminish it, marine barometers are constructed with the tube contracted for a considerable part of its length.

pumpkin (pump'kin), *n.* [Formerly also *pumkin* (and in popular use, though spelled *pumpkin*, now generally pronounced pung'kin, as if written *punkin*): an altered form, simulating the term. *-kin*, of *pumpion*.] The fruit of a variety of *Cucurbita Pepo;* also, the plant which produces it. The plant is a coarse decumbent vine, often many feet long; the leaves are heart-shaped and somewhat lobed, nearly a foot across, and rough and almost prickly, as are also their hollow stalks. The gourd-like fruit is nearly globular or somewhat oblong, flattened at the ends, a foot or more in length, and of a deep orange-yellow color when ripe. Inside it is partly filled with a dryish stringy pulp containing the seeds; the esculent part is a fleshy layer an inch or two thick beneath the rind. The pumpkin is of supposed Asiatic origin, and is cultivated in many countries; in England it has been cultivated either as a curiosity or for food since 1570. It is thought to have been known to the American aborigines, and to have been planted by them among their maize. In America it has been largely given as food to cattle, and is also used on the table, especially in pumpkin-pie; but in culinary use it is now largely superseded by the squash, and is less grown for other purposes than formerly. The pumpkin has various subvarieties, and is closely related to the vegetable marrow. (See *marrow*[1].) The name is sometimes wrongly applied to forms of the squash. In England occasionally called *gourd* or *pumpkin-gourd*. See *Cucurbita*.

pun[1] (pun), *v. t.*; pret. and pp. *punned*, ppr. *punning*. [< ME. **punen*, < AS. *punian*, beat, pound: see *pound*[3], the same word in diff. form.] To beat; strike with force; ram; pound, as in a mortar; reduce to powder. [Obsolete or prov. Eng.]

> He would *pun* thee into shivers with his fist, as a sailor breaks a biscuit. *Shak.*, T. and C., ii. 1. 42.

> The roots must be first sliced and dried in the sunne, or by the fire, and then, being *punned* into floure, will make good bread. *Hakluyt's Voyages*, III. 272.

> Yea sometimes in the winter season, when he was in the country, he refused not to cleave wood, and to *punne* barley, and to doe other country works only for the exercise of his body. *Coghan's* Haven of Health, p. 225.

> Too much stress cannot be laid upon good sound *punning*. The earth, as it is thrown in, should be thoroughly well *punned* at every stage.
> *Preece and Sivewright*, Telegraphy, p. 196.

pun[2] (pun), *v.*; pret. and pp. *punned*, ppr. *punning*. [Usually explained as a particular use of *pun*[1], pound, as if to pound or beat words, as it were into new shapes (cf. *twist*, *wrest*, as used of words; *clench*, *clinch*, a pun); but this explanation requires the verb to have been orig. transitive, 'to pound' (sc. words); evidence of such a use is lacking, and it is not certain that the verb precedes the noun.] **I.** *intrans.* To make puns.

> Who dealt in doggrel, or who *punned* in prose.
> *Dryden*, tr. of Juvenal, x. 189.

II. *trans.* To affect by a pun.

> *Addison*, Spectator, No. 61.

pun[2] (pun), *n.* [See *pun*[2], *v.*] An expression in which the use of a word in two different applications, or the use of two different words pronounced alike or nearly alike, presents an odd or ludicrous idea; a play on words that are alike or nearly alike in sound but differ in meaning; a kind of verbal quibble.

> A *pun* can be no more engraven than it can be translated. When the word is construed into its idea, the double meaning vanishes. *Addison*, Ancient Medals, ii.

> A better *pun* on this word [gay] was made on the Beggar's Opera, which, it was said, made Gay rich, and Rich gay. *Walpole*, Anecdotes of Painting, V. 92, note.

= **Syn.** *Pun, Paronomasia, Assonance.* *Pun* and *paronomasia* are often confounded, but are in strictness distinct in form and effect. A *pun* is a play upon two senses of the same word or sound, and its effect is to excite a sense of the ludicrous: as,

> They went and *told* the sexton, and
> The sexton *toll'd* the bell.
> *Hood*, Sally Brown.

Even when taken into sober discourse, the *pun* has an effect at least of oddity: as,

> For *Suffolk's* duke, may he be *suffocate*.
> *Shak.*, 2 Hen. VI., i. 1. 124.

Hence modern taste excludes puns from serious writing and speaking. *Paronomasia* is rather the use of words that are nearly but not quite alike in sound, and it heightens the effect of what is said without suggesting the ludicrous: as, "Per *angusta* ad *augusta*"; "And catch with his *surcease success*," *Shak.*, Macbeth, i. 7. 4;

> To begirt the almighty throne
> *Beseeching* or *besieging*. *Milton*, P. L., v. 869.

As in these examples, it is most likely to be used where the words thus near in sound are far apart in meaning. It is very common in the original languages of the Bible, especially in the Old Testament, as in Isa. v. 7. An attempt to imitate it may be found in Mat. xxi. 41, revised version. *Assonance* is the bare fact of resemblance of sound, being generally accidental, and in the majority of cases disagreeable to the ear: as, *unfold old* truths, *our power, if of, is as, and Andrew drew, the then* condition. For the technical meaning of *assonance*, see def. 2 under that word.

puna (pö'nä), *n.* [Peruv.] In the Peruvian Andes, nearly the same as *paramo*.

punch[1] (punch), *v. t.* [< ME. *punchen* = Sp. *punchar* (< ML. *punctare*), *punzar* = Pg. *punçar* (< ML. **punctiare*, *punctuare*), pierce, prick, punch, sting, < ML. *punctuare*, *punctare*, pierce, prick, punch, < L. *punctum*, *punctus*, a point: see *point*[1], *n.* and *v.* The E. form is in part due to the related noun *puncheon* (see *puncheon*[1]), and has been in part confused with ME. *punchen*, var. of *punischen*, punish (see *punch*[2]), also with ME. *bunchen*, beat, strike (see *bunch*[2]).] 1. To make a hole or holes in with a punch or some similar instrument; pierce; perforate: as, to *punch* a metal plate.

> When I was mortal, my anointed body
> By thee was *punched* full of deadly holes.
> *Shak.*, Rich. III., v. 3. 125.

2. To make with or as with a punch: as, to *punch* a hole in something.—**Punching-and-shearing machine**, a machine having both punches and shearing-plates connected with the same standard or bed, and with the same driving pulley or motor.—**Punching-press**, a die-press constructed like an ordinary punching-machine.

punch[1] (punch), *n.* [< *punch*[1], *v.*; in part prob. abbr. of *puncheon*[1], q. v.] 1. A tool the working end of which is pointed, blunt, a continuous edge inclosing an area, or a pattern in relief or intaglio, and which acts either by pressure or percussion (applied in the direction of its longitudinal axis) to perforate or indent a solid material, or to drive out or in objects inserted in previously formed perforations or cavities. The pointed punch may be regarded as a chisel with a very narrow edge, cutting, therefore, in one point only, and forcing adjacent parts of the material asunder by a wedge-like action. The action of a punch with a continuous edge inclosing an area is also analogous to the action of a chisel. The action of a flat-nosed punch, when used with a die to which it is fitted, is that of a shear-blade, the parts of the material operated upon being separated by sliding over each other, instead of being wedged apart, as is the operation of the pointed punch. Hardened and tempered steel is the usual material of which punches are made. Solid punches with engraved faces are used for stamping-dies, as in coining, and with plain flat faces are used in connection with accurately fitted dies for making clean-cut holes in metal plates, and also for punching out blanks for buttons, coins, small gear-wheels, etc. Hollow punches, or punches having continuous edges inclosing an area, are principally used for cutting either very thin, soft sheet-metal, as tin, brass, or copper plates, or other soft flexible substances, as leather, paper, or cloth. The pointed punch is used for marking centers in the operation of turning, or for punching holes in thin materials where clean cutting is of no importance, as in punching holes in sheet-zinc or -tin for the reception of nails in nailing such sheets to wood.

Shelley*, Workshop Appliances, p. 166.—**Coopers' punch**, a punch operated by a lever and making two holes at once. It is used to punch rivet-holes in iron hoops.—**Duplex punch**. In *writing* and *printing*, a pointing off or separation of one part from another by arbitrary marks; specifically, the division of a composition into sentences and parts of sentences by the use of marks indicating intended differences of effect by differences of form. The points used for punctuation exclusively are the period or full-stop, the colon, the semicolon, and the comma. (See *point*[1], *n.*, 11 (*a*).) The interrogation- and exclamation-points serve also for punctuation in the place of one or another of these, while having a special rhetorical effect of their own; and the dash is also used, either alone or in conjunction with one of the preceding marks, in some cases where the sense or the nature of the pause required can thereby be more clearly indicated. (See *parenthesis*.) The modern system of punctuation was gradually developed after the introduction of printing, primarily through the efforts of Aldus Manutius and his family. In ancient writing the words were at first run together continuously; afterward they were separated by spaces, and sometimes by dots or other marks, which were made to serve some of the purposes of modern punctuation, and were retained in early printing. Long after the use of the present points became established, they were so indiscriminately employed that, if closely followed, they are often a hindrance rather than an aid in reading and understanding the text. There is still much uncertainty and arbitrariness in punctuation, but its chief office is now generally understood to be that of facilitating a clear comprehension of the sense. *Close punctuation*, characterized especially by the use of many commas, was common in English in the eighteenth century, and is the rule in present French usage; but *open punctuation*, characterized by the avoidance of all pointing not clearly required by the construction, now prevails in the best English usage. In some cases, as in certain legal papers, title-pages, etc., punctuation is wholly omitted.

The principles of *punctuation* are subtle, and an exact logical training is requisite for the just application of them. *G. P. Marsh*, Lects. on Eng. Lang., xix.

The orifice of the iris; the hole or opening in the iris through which light passes. The pupil appears usually as a black spot in the middle of the colored part of the eye, this appearance being due to the darkness of the back of the eye. The pupil contracts when the retina is stimulated, as by light, on accommodation for near distances and on convergence of the visual axes; pain may cause a dilatation. The size of the pupil is determined by the circular and radiating muscular fibers of the iris. It may also be influenced by drugs; thus, opium contracts and belladonna dilates the pupil. The same consequences may result from disease or injury. The shape of the pupil in most animals is circular, as the expression of the uniform action of the contractile fibers of the iris; but in many animals it is oval, elliptical, or slit-like. Thus, the pupil of the cat contracts to a mere chink in the sunlight, and dilates to a circle in the dark. The pupil of the horse is a broad, nearly parallel-sided fissure obtusely rounded at each end. The variability of the pupil in size is not less remarkable in owls than in cats, but in these birds it keeps its circular figure, changing in size from a mere point to a disk which leaves the iris a mere rim. The pupil sometimes gives zoological characters, as in distinguishing foxes from wolves or dogs. See *iris*, 6, and cuts under *eye*[1].

2. In *zoöl.*: (*a*) The central dark part of an ocellated spot. See *ocellus*, 4. (*b*) A dark, apparently interior, spot seen in the compound eyes of certain insects, and changing in position as it is viewed from different sides.—**Argyll-Robertson pupil**, a pupil which does not contract from light, but does with accommodation for short distances. 2. [*cap.*] One of a class of Protestants which arose in England in the sixteenth century. The Puritans maintained a strict Calvinism in doctrine, and demanded, in opposition to those who desired a reform of the church service, the substitution of one from which should be banished all resemblance whatever to the forms of the Roman Catholic Church. Large numbers of them were found both in and out of the Church of England, and various repressive measures were directed against them by the sovereigns and by the prelates Parker, Whitgift, Bancroft, Laud, and others. In the reign of Charles I. the Puritans developed into a political party and gradually gained the ascendancy, but lost it on Cromwell's death, and after the Restoration ceased to be prominent in history. During their early struggles many of them emigrated to New England, especially to the Massachusetts Bay Colony. One band of Puritans who separated entirely from the Church were called *Separatists* or *Brownists*, and from them came the founders of the Plymouth Colony, often called *Pilgrim Fathers* or *Pilgrims*.

=Syn. *Puritan*, *Pilgrim*. Careful distinction should be made between the *Pilgrims* or *Pilgrim* Fathers, who settled at Plymouth in 1620, and the *Puritans*, who in 1628–30 founded the colony of Massachusetts Bay at Salem and Boston.

In our own tongue we may err egregiously against *propriety*, and consequently against *purity* though all the words we employ be English, and though they be construed in the English idiom.
